Advanced Hierarchical Control and Stability Analysis of DC Microgrids Andrei-Constantin Braitor,2022-02-20 This book introduces several novel contributions into the current literature Firstly given that microgrid topologies are paramount in theoretical analysis the author has proposed a rigorous method of computing the network s admittance matrix and developed to facilitate the stability analysis of DC microgrids supplying nonlinear loads This unique approach enabled the factorisation of the admittance matrix in a particular way that facilitates a rigorous theoretical analysis for deriving the stability conditions Secondly author has proposed a unified control

structure at the primary control layer that maintains the widely accepted droop based approaches and additionally ensures crucial current and voltage limiting properties thus offering an inherent protection to distributed energy resources He has formalised the control design proofs using Lyapunov methods and nonlinear ultimate boundedness theory for both parallel and meshed microgrid configurations Moreover he has developed a distributed secondary controller using a diffusive coupling communication network on top of the primary control to achieve voltage restoration and improve the power sharing In this way the author has formulated the complete hierarchical control scheme In this high order nonlinear setting he has analytically proven closed loop system stability of the overall system for the first time using two time scale approaches and singular perturbation theory by formulating rigorous theorems that introduce straightforward conditions that guide the system and control design and demonstrate system stability at the desired equilibrium point In addition the author has provided a straightforward algorithm for simple testing of system stability and explored from a graphical perspective by giving an interpretation to the effect of the nonlinear load onto the system performance and stability

Investigation on Performance Advantage of Functionally Integrated Magnetic Components in Decentralised Power Electronic Applications
Kleeb, Thiemo, 2017 The functional integration of magnetic components is a known technique in order to enable high power densities for power electronic converters Magnetic components are mandatory in many power electronic converters and many topologies demand more than one magnetic component Therefore the functional integration of magnetic components allows realising several magnetic functions within one component This technique promises lower total size losses and costs without switching frequency increase There are several examples in the literature for coupled inductors common differential mode chokes or transformer inductor components One centralised question of this work is to explore the performance advantage of functionally integrated magnetic components in comparison to discrete components Many applications allow the introduction of simple magnetic structures and standard cores or simple modifications of these flux bypasses in order to enable the required component behaviour The design guidelines introduced in this work enable the design of functional integrated magnetic components with limited effort and therefore the application of components which enable superior performance regarding size and power loss for the applications
