■ INTRODUCTION

Laboratory diagnosis plays a vital role in the diagnosis of parasitic infections. Following diagnostic techniques are used for diagnosis of parasitic infections:

- Morphological identification techniques either macroscopically or microscopically
- Culture methods
- Immunodiagnostic methods
- Molecular methods
- Intradermal skin tests
- Xenodiagnostic techniques
- Animal inoculation methods
- Imaging techniques.

■ MORPHOLOGICAL IDENTIFICATION TECHNIQUES

The parasites can be identified by their morphology either macroscopically or microscopically. Various morphological forms of different parasites can be seen in different specimens (Table 15.1).

Microscopically they can be visualized directly by wet mount (saline/iodine) for stool specimen or either by different staining techniques.

Examination of Feces

Specimen Collection

- Stool specimens should be collected in a wide-mouthed, clean, leak-proof, screw capped containers and should be handled carefully to avoid acquiring infection from organisms present in stool
- **Timing:** Specimen should be collected before starting antiparasitic drugs and closer to the onset of symptoms
- **Frequency:** At least three stool specimens collected on alternate days are adequate to make the diagnosis of intestinal parasitic diseases (third specimen should be obtained after purgatives).
- **When to examine:** Liquid stool specimens should be examined within 15–30 minutes,
