

SECOND EDITION

DIGITAL INTEGRATED CIRCUITS

A DESIGN PERSPECTIVE

JAN M. RABAEY
ANANTHA CHANDRAKASAN
BORIVOJE NIKOLIĆ

Unique in approach, this text offers comprehensive coverage of new design methodologies and implementation strategies of digital ICs and brings to the forefront a number of new issues that impact the reliability, cost, performance, and power dissipation of chips now reaching the 100-nm realm. This means increased importance in circuit design of deep submicron transistor effects, interconnect, signal integrity, high-performance and low-power design, timing and clock distribution. In contrast to the first edition, the present text focuses entirely on CMOS ICs. While introducing these changes, the text preserves the spirit and goals of the first edition—that is, it successfully bridges the gap between the circuit and system visions on digital design.

Beginning with solid discussions on the operation of electronic devices and in-depth analysis of the nucleus of digital design—the inverter—the text gradually channels this knowledge into the design of more complex modules such as gates, controllers, adders, multipliers, and memories. Actual design examples and layouts are interspersed throughout the text. Besides numerous examples, each chapter also contains a number of problems or brain teasers that provoke thinking and understanding while reading. Fully worked-out design problems are available from the web site: (<http://bwrc.eecs.berkeley.edu/icBook>).

The text is intended for use in digital circuit design courses conducted for undergraduate and postgraduate students of electronics.

Technologies , Custom Memory Management Methodology Francky Catthoor, Sven Wuytack, G.E. de Greef, Florin Banica, Lode Nachtergaele, Arnout Vandecappelle, 2013-03-09 The main intention of this book is to give an impression of the state of the art in system level memory management data transfer and storage related issues for complex data dominated real time signal and data processing applications The material is based on research at IMEC in this area in the period 1989 1997 In order to deal with the stringent timing requirements and the data dominated characteristics of this domain we have adopted a target architecture style and a systematic methodology to make the exploration and optimization of such systems feasible Our approach is also very heavily application driven which is illustrated by several realistic demonstrators partly used as red thread examples in the book Moreover the book addresses only the steps above the traditional high level synthesis scheduling and allocation or compilation traditional or ILP oriented tasks The latter are mainly focussed on scalar or scalar stream operations and data where the internal structure of the complex data types is not exploited in contrast to the approaches discussed here The proposed methodologies are largely independent of the level of programmability in the data path and controller so they are valuable for the realisation of both hardware and software systems Our target domain consists of signal and data processing systems which deal with large amounts of data
