Mixed Design of Integrated Circuits and Systems Andrzej Napieralski,Zygmunt Ciota,Augustin Martinez,Gilbert De Mey,Joan Cabestany,2012-12-06 Very fast advances in IC technologies have brought new challenges into the physical design of integrated systems The emphasis on system performance in lately developed applications requires timing and power constraints to be considered at each stage of physical design The size of ICs is decreasing continuously and

the density of power dissipated in the circuits is growing rapidly The first challenge is the Information Technology where new materials devices telecommunication and multimedia facilities are developed The second one is the Biomedical Science and Biotechnology The utilisation of bloodless surgery is possible now because of wide micro sensors and micro actuators application Nowadays the modern micro systems can be implanted directly into the human body and the medicine can be applied right in the proper time and place in the patient body The low power devices are being developed particularly for medical and space applications This has created for designers in all scientific domains new possibilities which must be handed down to the future generations of designers In this spirit we organised the Fourth International Workshop MIXED DESIGN OF INTEGRATED CIRCUITS AND SYSTEMS in order to provide an international forum for discussion and the exchange of information on education teaching experiences training and technology transfer in the area of microelectronics and microsystems

Surviving the SOC Revolution , Surviving the SOC Revolution Henry Chang,L.R. Cooke,Merrill Hunt,Grant Martin,Andrew McNelly,Lee Todd,2007-05-08 The aim of Surviving the SOC Revolution A Guide to Platform Based Design is to provide the engineering community with a thorough understanding of the challenges involved when

moving to system on a chip and deliver a step by step methodology to get them there Design reuse is most effective in reducing the cost and development time when the components to be shared are close to the final implementation On the other hand it is not always possible or desirable to share designs at this level since minimal variations in specification can result in different albeit similar implementations However moving higher in abstraction can eliminate the differences among designs so that the higher level of abstraction can be shared and only a minimal amount of work needs to be carried out to achieve final implementation The ultimate goal is to create a library of functions and of hardware and software implementations that can be used for all new designs It is important to have a multilevel library since it is often the case that the lower levels that are closer to the physical implementation change because of the advances in technology while the higher levels tend to be stable across product versions It is most likely that the preferred approaches to the implementation of complex embedded systems will include the following aspects Design costs and time are likely to dominate the decision making process for systems designers Therefore design reuse in all its shapes and forms will be of paramount importance Designs have to be captured at the highest level of abstraction to be able to exploit all the degrees of freedom that are available Next generation systems will use a few highly complex Moore s Law Limited part types but many more energy power cost efficient medium complexity 10M 100M gates in 50nm technology chips working concurrently to implement solutions to complex sensing computing and signaling actuating problems Such chips will most likely be developed as an instance of a particular platform That is rather than being assembled from a collection of independently developed blocks of silicon functionality they will be derived from a specific family of micro architectures possibly oriented toward a particular class of problems that can be modified extended or reduced by the system developer These platforms will be highly programmable Both system and software reuse impose a design methodology that has to leverage existing implementations available at all levels of abstraction LIST This book deals with the basic principles of a design methodology that addresses the concerns expressed above The platform concept is carried throughout the book as a unifying theme to reuse This is the first book that deals with the platform based approach to the design of embedded systems and is a stepping stone for anyone who is interested in the real issues facing the design of complex systems on chip From the Preface by Alberto Sangiovanni Vincentelli
