Performance of MCrAlX coatings Pimin Zhang,2019-11-04 MCrAlY coatings M Ni and or Co are widely used for the protection of superalloy components against oxidation and hot corrosion in the hot sections of gas turbines The drive for coating systems to bestow adequate oxidation and corrosion resistance upon the components becomes urgent as an inevitable result of the necessary improvement in engine combustion efficiency and service lifetime Through the careful design of the composition MCrAlY coating performance can be optimized to meet the needs under different service conditions and component materials therefore MCrAlX with X stands for the minor alloying elements is used to highlight the

effect In the present thesis the performance of new MCrAlX coatings is investigated with respect to oxidation hot corrosion and interactions between coating superalloy substrates Oxidation of MCrAlX coatings can be generally categorized into initial steady and close to end stages Coating performance can be affected by various factors at different stages therefore experiments were designed by targeting the oxidation stages Investigation on the initial stage oxidation behavior of MCrAlY coatings with post deposition surface treatments reveals the different growth mechanisms of alumina scales Surface treatments significantly reduce the alumina growth rate by suppressing transient alumina development and aiding the early formation of Al₂O₃ which improves the long term oxidation performance of the coating Similarly the modification of minor alloy elements in MCrAlX coatings also serves the purpose The oxidation behavior of new MCrAlX coatings was investigated at the steady oxidation stage followed by the microstructure observation thermodynamic and kinetic simulations As an alternative reactive element addition of Y Ce shows a negative effect on the formation of columnar alumina scales of high strain tolerance In comparison Fe or Ru addition shows no influence on alumina growth rather than strengthening the phase stability in the coating and reducing the interdiffusion between coating substrate through different mechanisms As the oxidation proceeds to the close to end stage a reliable criterion to estimate the capability of coating to form Al₂O₃ is of great importance to accurately evaluate coating lifetime A temperature dependent critical Al activity criterion was proposed to better predict the formation of a continuous Al₂O₃ scale based on correction of elemental activity using thermodynamic database to replace the empirical Al concentration based criterion Severe interdiffusion occurs between coating substrate during high temperature oxidation accelerating the degradation of the system Interdiffusion behavior of diffusion couples of superalloys MCrAlX coatings were examined It is highlighted that the recrystallization of superficial layer of the substrate contributes to the secondary reaction zone formation and element interdiffusion controls subsequent zone thickening Study on Type I hot corrosion behavior of new MCrAlX coatings shows that the addition of Fe has no influence on basic fluxing reactions before severe Al depletion from the coating occurs Instead it boosts the effective Al supply of coating by shifting the equilibrium concentration of Al in the phase to a low Al level Besides the pre mature coating degradation at the coating substrate interface was due to the fast growth of corrosion products from substrate induced large local volume expansions resulting in early coating spallation MCrAlY ytbel ggningar M Ni och eller Co anv nds ofta f r att skydda komponenter tillverkade av superlegeringar mot oxidation samt h gtemperaturskorrosion i de heta gasturbindelarna F rb ttrad f rbr nningseffektivitet och livsl ngd hos gasturbiner g r att ytbel ggningssystemen m ste besitta adekvata oxidations och korrosionsmotst nd Genom att omsorgsfullt utforma den kemiska sammans ttningen hos MCrAlY ytbel ggningar kan deras prestanda optimeras f r att m ta kraven fr n olika driftf rh llanden samt olika substratmaterial d rf r anv nds beteckningen MCrAlX f r att belysa f r ndrningar av den kemiska kompositionen d r X st r f r reaktiva legerings mnen som tills tts i mindre m ngder I denna avhandling unders ks prestandan hos en ny MCrAlX ytbel ggning med h nsyn till oxidation h
