Top-Down Design of High-Performance Sigma-Delta Modulators Fernando Medeiro, Belén Pérez-Verdú, Angel Rodríguez-Vázquez, 1998-11-30 The interest for Δ modulation based NO converters has significantly increased in the last

years The reason for that is twofold On the one hand unlike other converters that need accurate building blocks to obtain high resolution Δ converters show low sensitivity to the imperfections of their building blocks This is achieved through extensive use of digital signal processing a desirable feature regarding the implementation of Δ interfaces in mainstream CMOS technologies which are better suited for implementing fast dense digital circuits than accurate analog circuits On the other hand the number of applications with industrial interest has also grown In fact starting from the earliest in the audio band today we can find Δ converters in a large variety of Δ interfaces ranging from instrumentation to communications These advances have been supported by a number of research works that have led to a considerably large amount of published papers and books covering different sub topics from purely theoretical aspects to architecture and circuit optimization However so much material is often difficultly digested by those unexperienced designers who have been committed to developing a Δ converter mainly because there is a lack of methodology In our view a clear methodology is necessary in Δ modulator design because all related tasks are rather hard
