

Automotive LPG and Natural Gas Engines

HIGHLIGHTS

- **PROCESS AND TECHNOLOGY STATUS** – Internal combustion engines running on liquid petroleum gas (LPG) are well-proven technologies and work much like gasoline-powered spark-ignition engines. Natural gas (NG) engines are also well-proven. They are typically used as spark-ignition engines for bi-fuelled (gasoline/CH₄) cars, but have also been used, for example, in compression-ignition (i.e. diesel-type) engines for heavy-duty vehicles. Both LPG and NG are not used alone, but always in bi-fuel vehicles, in combination with gasoline. In bi-fuel vehicles two fuels are stored in separate tanks and the engine runs on one fuel at a time. Bi-fuel vehicles have the capability to switch back and forth from gasoline to the other fuel, manually or automatically. In the past, most bi-fuel vehicles were derived from native gasoline vehicles by adding a tank and an electronic injection regulation system for the alternative fuel. In recent years, the offer of ‘native’ bi-fuel vehicles has increased; they have two separate tanks and two alternative injection regulation programs.
- **PERFORMANCE AND COSTS** – Bi-fuel LPG cars can reduce greenhouse gas (GHG) emissions by 15% as compared to petrol-operation. NG cars can achieve GHG reductions of up to 25%. The energy efficiency of engines running on natural gas is generally equal to that of gasoline engines, but is lower if compared with modern diesel engines. The conversion costs for LPG vehicles range from €1130 to €2740 (10-15% incremental cost). The conversion costs for light-duty NG vehicles are currently between €1640 and €2190 (10-15% incremental cost). When running on LPG or NG, CO₂ emissions are at least 10% or 20% lower, respectively, if compared to gasoline. Actual emissions depend on the share of mileage run on petrol.
- **POTENTIAL AND BARRIERS** – In 2008, more than 7 million Natural Gas Vehicles (NGVs) were on the roads, most notably in Argentina, Brazil, Pakistan, Italy, India, China, and Iran, with South America leading the global market with a 48% share. The number of LPG/NG kits sold globally is estimated to reach 8.0 million by 2012. An appropriate infrastructure, along with governmental support, may accelerate the growth of LPG and NG as global alternative fuels. Bottlenecks that may slow down the development and deployment of LPG and NG technologies are the lack of appropriate infrastructure for fuel distribution and refuelling, the higher vehicle cost, and the competition from other fuel options (e.g. biofuels).

TECHNOLOGY STATUS AND PERFORMANCE

Internal combustion engines running on liquid petroleum gas (LPG) and natural gas are well-proven technologies and work much like gasoline-powered spark-ignition engines [18]. They are normally used as spark-ignition engines for bi-fuelled (gasoline/CH₄) cars, but have also been used, for example, in compression-ignition (i.e. diesel-type) engines for heavy-duty vehicles. Both LPG and NG is not used alone, but always in bi-fuel vehicles, in combination with gasoline. In bi-fuel vehicles two fuels are stored in separate tanks and the engine runs on one fuel at a time¹. Bi-fuel vehicles have the capability to switch back and forth from gasoline to the other fuel, manually or automatically. In the past most bi-fuel vehicles were derived from native gasoline vehicles by adding a tank and an electronic injection regulation system for the alternative fuel. In recent years the availability of ‘native’ bi-fuel vehicles has increased; they have two separate tanks and two alternative injection regulation programs.

■ **LPG Vehicles** work much like gasoline-powered vehicles with a spark-ignited engines. LPG is stored as a liquid in a separate steel or composite vessel at the pressure of 10 bar, although it can stand a pressure of

20-30 bar. LPG supply to the engine is controlled by a regulator or vaporizer, which converts the LPG to a vapour. The vapour is fed to a mixer located near the intake manifold, where it is metered and mixed with filtered air before being drawn into the combustion chamber where it is burned to produce power, just like gasoline. LPG injection engines, developed over the past 15 years, do not vaporize the LPG. Instead, the LPG is injected into the combustion chamber in liquid form. These systems have proven to be reliable in terms of power, engine durability, and cold starting.

In the 1970s Toyota made a number of LPG-only engines for cars. Today, most LPG vehicles are conversions from petrol vehicles. Many car makers offer conversion/bi-mode vehicles. LPG technology is rather popular in the European Union, Australia, Hong Kong, India, South Korea, Serbia, the Philippines, Turkey and Armenia. The world leader is probably Armenia where about 20-30% of vehicles run on LPG which offers a cheap alternative to diesel and petrol. LPG engines and fuelling systems are also available for medium- and heavy-duty vehicles such as school buses and street sweepers. For example, the school districts in Dallas, Denton, Texas, Portland and Oregon rely on LPG-fuelled school buses. [8].

¹ unlike flexible-fuel vehicles (‘dual-fuel’), that store the two different fuels mixed together in the same tank, and the resulting blend is burned in the unique combustion chamber.

Technologies and Approaches to Reducing the Fuel Consumption of Medium- and Heavy-Duty Vehicles National Research Council, Transportation Research Board, Division on Engineering and Physical Sciences, Board on Energy and Environmental Systems, Committee to Assess Fuel Economy Technologies for Medium- and Heavy-Duty Vehicles, 2010-08-30 *Technologies and Approaches to Reducing the Fuel Consumption of Medium and Heavy Duty Vehicles* evaluates various technologies and methods that could improve the fuel economy of medium and heavy duty vehicles such as tractor trailers transit buses and work trucks The book also recommends approaches that federal agencies could use to regulate these vehicles fuel consumption Currently there are no fuel consumption standards for such vehicles which account for about 26 percent of the transportation fuel used in the U S The miles per gallon measure used to regulate the fuel economy of passenger cars is not appropriate for medium and heavy duty vehicles which are designed above all to carry loads efficiently Instead any regulation of medium and heavy duty vehicles should use a metric that reflects the efficiency with which a vehicle moves goods or passengers such as gallons per ton mile a unit that reflects the amount of fuel a vehicle would use to carry a ton of goods one mile This is called load specific fuel consumption LSFC The book estimates the improvements that various technologies could achieve over the next decade in seven vehicle types For example using advanced diesel engines in tractor trailers could lower their fuel consumption by up to 20 percent by 2020 and improved aerodynamics could yield an 11 percent reduction Hybrid powertrains could lower the fuel consumption of vehicles that stop frequently such as garbage trucks and transit buses by as much 35 percent in the same time frame [Pathways for a transition to a sustainable hydrogen transportation fuel infrastructure in California](#) Marlene Hilkert, 2004-02-20

Inhaltsangabe Abstract As society enters the 21st century there is a growing awareness of the burdens being placed on the planet as its ability to keep up with the demands of modern society are strained One of the major contributors to this burden happens to be a main resource required for sustained development Energy has always been and will always be a necessary resource for existence Since the industrial revolution fossil fuels such as coal and oil have been the main stay fuel to accommodate society s appetite As the demand for this resource increases the climatic and socio economic costs of this fuel become more acute and it is well documented that the supply of this fuel is not endless One of the major consumers of this fuel as a society is the transportation sector The processes in place which take it from the ground to its combustion as a fuel are some of the main culprits which adversely affect the planet This thesis explores the issues associated with the introduction of another energy resource Hydrogen as a replacement fuel for the transportation industry It is argued that for

the transportation sector Hydrogen offers the most promising alternative as a fuel Making Hydrogen readily available and affordable through the retail infrastructure is of paramount importance if its widespread use is to be achieved The logistics of this are explored and it is believed that the introduction of small Hydrogen fuelers at existing retail outlets is the preferred method to instantiate the transition in the short to medium term Those fueling stations can utilize grid electricity to produce Hydrogen by the means of water electrolysis or take advantage of the existing Natural Gas distribution infrastructure to produce Hydrogen via steam reformation This thesis examines the Well to Wheels impacts and economic feasibility of those options and compares them to existing vehicle and fuel technologies The state of California was chosen as a target market due to its high automobile density the resulting pollution issues and its clear mandate on promoting alternative energy sources
