

Standard Test Method for Consolidated Drained Triaxial Compression Test for Soils¹

This standard is meant solely for use in conjunction with the ASTM International Catalogue of Standards, published for sale at regular intervals, as the sole reference for the use of this standard. It contains no provisions relating to the use of test equipment, or equipment location (if necessary as indicated) except where the machine is specified.

1. Scope

1.1 This test method covers the determination of strength and stress-strain relationships of a cylindrical specimen of either intact or remoulded soil. Specimens are consolidated and drained in compression with drainage at a constant rate of axial deformation (strain controlled).

1.2 This test method provides for the calculation of principal stresses and axial compression by measurement of axial load, axial deformation, and volume/area changes.

1.3 This test method provides data useful in describing strength and deformation properties such as Mohr strength envelopes. Generally, three specimens are tested at different effective consolidation stresses to define a strength envelope.

1.4 If this test method is used on cohesive soils, a test may take weeks to complete.

1.5 The determination of strength envelopes and the development of relationships to aid in interpreting and evaluating test results are beyond the scope of this test method and must be performed by a qualified experienced professional.

1.6 All values of soil parameters shall conform to the guidelines for significant digits and rounding established in Practice D5696.

1.6.1 The methods used to specify how data are collected, tabulated, or recorded in this standard are regarded as the industry standard. In addition, there are recommendations of the significant digits that generally should be retained. The provisions used do not consider unusual variations, proper for obtaining the data, special purpose studies or the combination of the test run. It is beyond the scope of this test method to consider significant digits used in analysis methods for engineering design.

1.7 Notes—The notes listed in all units are to be regarded as standard. The triaxial cells given in parentheses are nonmandatory alternatives, which are provided for information purposes only and are not considered standard. Improving of

test results in units other than SI shall not be regarded as non-conformance with this test method.

1.7.1 The international system of units (SI) shall be used when dealing with this test method. In this system, the stress (SI) represents a unit of force (newtons), while the area (SI) is in m^2 . The unit will be not given, unless denoted (F = force, resistance, or thrust).

1.7.2 It is common practice in the geotechnical engineering profession to commonly use pounds as representing both a unit of mass (force) and of force (SI). This typically involves two separate systems of units, that is, the absolute system and the gravitational system. It is internationally undesirable to maintain the use of two separate sets of units (pound units) within a single standard. As noted, this method includes the gravitational system of triaxial tests and does not implement the slug and the mass. However, the use of pounds as units (representing pounds of mass) when reporting density in lb/ft^3 shall not be regarded as non-conformance with this standard.

1.7.3 The term density and unit weight are often used interchangeably. Density is mass per unit volume whereas unit weight is force per unit volume. In this standard density is given only in SI units. When the density has been determined, the unit weight is calculated in SI or triaxial tests, as both.

1.8 This standard may involve hazardous materials, operations, and equipment. This standard does not purport to address all of the safety concerns of any particular work site. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.
