Library,1980 Proceedings of the Second International Symposium on the Biology of the Sipuncula Michael J. Boyle,Gisele Y. Kawauchi,2018 In June 1970 a diverse group of scientists attended the International Symposium on the Biology of the Sipuncula and Echiura at the Marine Biological Station in Kotor Yugoslavia Forty two years later in June 2012 an aspiring generation of like minded scientists convened the Second International Symposium on the Biology of the Sipuncula ISBS2 along the banks of the Fort Pierce Inlet to the Indian River Lagoon in Florida USA The primary objective of the second symposium was to collect the world s dedicated sipunculan biologists in one place for a long overdue face to face communication of past present and future research We met our objective This proceedings volume includes a brief summary of workshop discussions and field events and a compilation of selected research papers presented by an international group of sixteen scientists from twelve nations in attendance at the ISBS2 Herein we highlight molecular developmental morphological ecological and biogeographic diversity of adult and larval sipunculans And we introduce several of the outstanding research challenges associated with resolving sipunculan interrelationships establishing standard sets of taxonomic characters refining methods for identification of cryptic species reconstructing an evolutionary framework of developmental life history patterns and addressing implications of recent phylogenetic and phylogenomic hypotheses that have relocated the ancient radiation of unsegmented sipunculan body plans within the predominantly segmented Annelida Provided by publisher Beche-de-mer Information Bulletin ,2005 *Initial Settlement of Marine Invertebrate Larvae* Cheryl Ann Hannan,1984 The hypothesis that planktonic larvae of benthic invertebrates sink through the water like passive particles in turbulent flows near the seabed was tested in the field using

several groups of geometrically different sediment trap designs A priori predictions regarding the rank order that the various traps would collect larvae in the field were dictated from laboratory flume experiments to determine the relative particle collection efficiencies of the traps The flume flow was seeded with particles having fall velocities similar to those measured in the laboratory for nonswimming polychaete larvae The flume flow speed of about 10 cm sec was within the range of near bottom current velocities measured during trap collection intervals at the field study site The passive sinking hypothesis could not be falsified for collections of organisms from three invertebrate phyla polychaetes bivalves and enteropneusts in seven field experiments Thus hydrodynamical processes must be included in any future studies of mechanisms that determine patterns of larval settlement Other processes that could have produced the results now must be tested against the passive sinking alternative hypothesis If larvae sink like passive particles in near bottom flows as the results of this study suggest then larvae may initially reach the seafloor at sites where particulates with fall velocities similar to larvae initially settle
