Atmosphere, Ocean and Climate Dynamics John Marshall, R. Alan Plumb, 2007-12-19 For advanced undergraduate and beginning graduate students in atmospheric oceanic and climate science Atmosphere Ocean and Climate Dynamics is an introductory textbook on the circulations of the atmosphere and ocean and their interaction with an emphasis on global scales It will give students a good grasp of what the atmosphere and oceans look like on the large scale and why they look that way The role of the oceans in climate and paleoclimate is also discussed The combination of observations theory and accompanying illustrative laboratory experiments sets this text apart by making it accessible to students with no prior training in meteorology or oceanography Written at a mathematical level that is appealing for undergraduates and beginning graduate students Provides a useful educational tool through a combination of observations and laboratory demonstrations which can be viewed over the web Contains instructions on how to reproduce the simple but informative laboratory experiments Includes copious problems with sample answers to help students learn the material

Ocean Processes in Climate

Dynamics P.M. Malanotte-Rizzoli, Allan R. Robinson, 2012-12-06 One of the most crucial but still very poorly understood topics of oceanographic science is the role of ocean processes in contributing to the dynamics of climate and global change This book presents a series of high level lectures on the major categories of ocean atmosphere processes Three of these major issues are the focus of the lectures 1 air sea interaction processes 2 water mass formation dispersion and mixing 3 general circulation with specific emphasis on the thermohaline component Global examples in the world ocean are provided and discussed in the lectures In parallel the Mediterranean Sea is a laboratory basin in providing analogues of the above global processes relevant to climate dynamics They include the Mediterranean thermohaline circulation with its own conveyor belt intermediate and deep water mass formation and transformations dispersion and mixing No other book in the field provides a review of fundamental lectures on these processes coupled with global examples and their Mediterranean analogues

Topics in Geophysical Fluid Dynamics: Atmospheric Dynamics, Dynamo Theory, and Climate Dynamics M. Ghil, S. Childress, 2012-12-06 The vigorous stirring of a cup of tea gives rise as we all know to interesting fluid dynamical phenomena some of which are very hard to explain In this book our cup of tea contains the currents of the Earth's atmosphere oceans mantle and fluid core Our goal is to understand the basic physical processes which are most important in describing what we observe directly or indirectly in these complex systems While in many respects our understanding is measured by the ability to predict the focus here will be on relatively simple models which can aid our physical intuition by suggesting useful mathematical methods of investigation These elementary models can be viewed as part of a hierarchy of models of increasing complexity moving toward those which might be usefully predictive The discussion in this book will deal primarily with the Earth Interplanetary probes of Venus Mars Jupiter and Saturn have revealed many exciting phenomena which bear on geophysical fluid dynamics They have also enabled us to see the effect of changing the values of certain parameters such as gravity and rotation rate on geophysical flows On the other hand satellite observations of our own planet on a daily and hourly basis have turned it into a unique laboratory for the study of fluid motions on a scale never dreamt of before the motion of cyclones can be observed via satellite just as wing tip vortices are studied in a wind tunnel

Global Ecodynamics Kirill Y. Kondratyev, Vladimir F. Krapivin, V. P. Savinykh, Costas A. Varotsos, 2012-12-06. During recent decades, the stirring up of the processes of globalization practically in all spheres of present-day civilization activities has aggravated and brought forth numerous problems resulting from the nature-society interaction. It has become apparent that to solve these problems, it is necessary to develop new concepts and approaches to the interpretation of global environmental changes that would enable one to select the first priority directions in studies and to reliably assess the state of the nature-society system (NSS). One of these priorities is to predict global climate change. The growing interest in the problem of global climate change, determined by its practical importance and by available contradictory estimates of the anthropogenic contribution to climate change, necessitates a systematization of knowledge of and data on the observed climate change and causes of this change. Despite an enormous amount of projects and programmes of studies of past and present climatic trends, the problem of reliable prediction of future climate change remains far from being solved. Emissions to the atmosphere of greenhouse gases (GHGs), mainly carbon dioxide, is considered as one of the main causes of an expected climate warming, resulting in sufficiently negative consequences for humankind. Therefore, an attempt has been made in this book to construct a formalized technology to assess the level of the greenhouse effect due to anthropogenic sources of carbon dioxide as well as the effects of other gas components.

Global Ecodynamics, 2004-07. Opening with a survey of contemporary global ecodynamics, including its basic components, this book goes on to discuss greenhouse effect problems in the context of global carbon cycle dynamics. The coverage includes land ecosystem changes, air-sea exchange models, high-latitude environmental dynamics, and a discussion of basic aspects of global environmental modelling and relevant monitoring systems. The volume concludes by examining society systems with emphasis on the problems of sustainable development.

Stochastic Climate Models Peter Imkeller, Jin-Song von Storch, 2012-12-06. The proceedings of the summer 1999 Chörin workshop on stochastic climate models captures well the spirit of enthusiasm of the workshop participants engaged in research in this exciting field. It is amazing that nearly 25 years after the formal theory of natural climate variability generated by quasi-white noise weather forcing was developed, and almost 35 years after J. M. Mitchell first suggested this

mechanism as the origin of sea surface temperature fluctuations and climate variability there have arisen so many fresh perspectives and new applications of the theory The workshop has succeeded admirably in highlighting these new aspects while clarifying the position of stochastic climate modelling within the general framework of climate research and mathematical modelling The organizers can be congratulated in bringing together leading researchers covering a wide range of scientific expertise from mathematicians concerned with the derivation of stochastic models from first principles to applied climate modellers trying to understand the dynamics of the complex climate system Following the first burst of stochastic modelling papers in the decade from the mid seventies to the mid eighties in which the viability of the concept was demonstrated using relatively simple conceptual models there was a lull of work in this field One awaited the development of more sophisticated climate models with which one could carry out realistic quantitative analyses of the implications of stochastic forcing for the global climate system Now that these models have become widely available it is natural that one is witnessing a resurgence of stochastic modelling investigations
