Compiler Construction K.V.N. Sunitha, 2013 Designed for an introductory course this text encapsulates the topics essential for a freshman course on compilers The book provides a balanced coverage of both theoretical and practical aspects The text helps the readers understand the process of compilation and proceeds to explain the design and construction of compilers in detail The concepts are supported by a good number of compelling examples and exercises

Languages and Automata Benjamin Steinberg, 2024-10-21 This reference discusses how automata and language theory can be used to understand solutions to solving equations in groups and word problems in groups Examples presented include how Fine scale complexity theory has entered group theory via these connections and how cellular automata has been generalized into a group theoretic setting Chapters written by experts in group theory and computer science explain these connections

Designing a New Class of Distributed Systems Rao Mikkilineni, 2011-11-02 Designing a New Class of Distributed Systems closely examines the Distributed Intelligent Managed Element DIME Computing Model a new model for distributed systems and provides a guide to implementing Distributed Managed Workflows with High Reliability Availability Performance and Security The book also explores the viability of self optimizing self monitoring autonomous DIME based computing systems Designing a New Class of Distributed Systems is designed for practitioners as a reference guide for innovative distributed systems design Researchers working in a related field will also find this book valuable

Topological and Ergodic Theory of Symbolic Dynamics Henk Bruin, 2023-01-20 Symbolic dynamics is essential in the study of dynamical systems of various types and is connected to many other fields such as stochastic processes ergodic theory representation of numbers information and coding etc This graduate text introduces symbolic dynamics from a perspective of topological dynamical systems and presents a vast variety of important examples After introducing symbolic and topological dynamics the core of the book consists of discussions of various subshifts of positive entropy of zero entropy other non shift minimal action on the Cantor set and a study of the ergodic properties of these systems The author presents recent developments such as spacing shifts square free shifts density shifts mathematical B free shifts Bratteli Vershik systems enumeration scales amorphic complexity and a modern and complete treatment of kneading theory Later he provides an overview of automata and linguistic complexity Chomsky's hierarchy The necessary background for the book varies but for most of it a solid knowledge of real analysis and linear algebra and first courses in probability and measure theory metric spaces number theory topology and set theory suffice Most of the exercises have solutions in the back of the book

Physical (A)Causality Karl Svozil,2018-02-13 This book is open access under a CC BY 4 0 license This book addresses the physical phenomenon of events that seem to occur spontaneously and without any known cause These are to be contrasted with events that happen in a pre determined predictable lawful and causal way All our knowledge is based on self reflexive theorizing as well as on operational means of empirical perception Some of the questions that arise are the following are these limitations reflected by our models Under what circumstances does chance kick in Is chance in physics merely epistemic In other words do we simply not know enough or use too crude levels of description for our predictions Or are certain events truly that is irreducibly random The book tries to answer some of these questions by introducing intrinsic embedded observers and provable unknowns that is observables and procedures which are certified relative to the assumptions to be unknowable or undoable A somewhat iconoclastic review of quantum mechanics is presented which is inspired by quantum logic Postulated quantum un knowables are reviewed More exotic unknowns originate in the assumption of classical continua and in finite automata and generalized urn models which mimic complementarity and yet maintain value definiteness Traditional conceptions of free will miracles and dualistic interfaces are based on gaps in an otherwise deterministic universe
