

MORPHOMETRIC ANALYSIS AND PRIORITIZATION OF MICRO-SUB WATERSHEDS IN CHANDRAPRABHA BASIN

Kavita Mishra*, V.K. Kumra* and S.P. Mishra*

INTRODUCTION

Morphometric analysis involves evaluation of various linear, areal and gradient parameters of a watershed or basin. These parameters are very significant for watershed management and hydrogeomorphological investigation. Drainage lines / stream segments provide opportunity for both, water recharge through the minor gullies and discharge as run-off. It also shows the quantity of erosion, water logging, flood, drought etc. which significantly help to watershed management. The drainage characteristics of a basin are influenced by not only climatic elements but also by the geologic (lithology and structure), geomorphic factors (relief), and other surface properties. Prioritization of micro sub-watersheds based on morphometric parameters may largely help in comprehensive watershed management and planning with multiple

objectives such as erosion control, reduction in sediment, ground water storage and efficient use of land and water resources. Although various geomorphological parameters and related models have been developed for measuring and mapping the spatial extent of soil erosion by different scholars (Verstappen, 1983 and Mishra, 1998), yet the assessment of erosion hazard and prioritization using morphometric parameters like relief ratio, drainage density, drainage texture, bifurcation ratio etc. has significantly been worked out by several scholars like Biswas, *et.al.*(1999); Suresh, *et.al.*(2004); Thakkar, *et.al.* (2007); Javed, *et.al.* (2009).

Under the impetus supplied by Horton (1932, 1945), the description of drainage basins and channel networks was transformed from a purely qualitative and deductive study to a quantitative study to a rigorous quantitative science capable of

Quantitative Morphometric Analysis of a Watershed Kuldeep Pareta,Upasana Pareta,2012-03 The prime purpose of this book is to present the detail morphometric characteristics of a watershed based on digital terrain model and GIS A short glance is presented on the geology and geomorphology of Karawan watershed of Yamuna basin India The basic concept of Indian watershed codification system is also presented in the book Extensive morphometric parameters i e drainage network 16 basin geometry 28 drainage texture analysis 7 and relief characterizes 34 are carried out based on digital analysis The parameters are discussed in detail and values are obtained using ASTER DEM data and ArcGIS 10 software The book is useful for the instructors research scholars and students of geomorphology for a deeper study in the field of drainage basin analysis *Prioritization, Morphometric and Hypsometric Ananlysis of Subwatersheds* Ashokkumar Naralasetty,Maheshwara Babu B.,Meerabai K. P.,2014-08-07 Morphometry deals with the management and mathematical analysis of the configuration of the earth s surface and of the slopes and dimensions of its landforms It is used to determine the geometry of the watershed especially among its stream network Morphometry gives a little idea of erodibility of soil Watershed characteristics play a vital role on the hydrologic performance of watersheds Hence a number of parameters which signify the watershed characteristics are evaluated from the topographical maps Various morphometric parameters are computed to evaluate the geomorphic stage of the basin which is the indication of intensity of erosion from the basin In the case of shortage of hydrologic data morphometric parameters play an important role in predicting the response of the catchment Hypsometric analysis aims at developing a relationship between horizontal cross section area of the subwatershed and its elevation in a dimensionless form For determination of hydrologic variables such as precipitation evaporation etc with respect to the altitude is useful by the hypsometric curve
