Background

The human body is a very complex system. There are more than 50 trillion single cells in the human body made up of more than 200 different cell types, and each perform a different function. For example, the primary function of red blood cells is to carry oxygen while the primary function of a muscle cell is contraction. Each cell type is shaped differently depending on its function. When groups of cells that perform the same or similar function are combined, a tissue is created. When a group of tissues combines to perform a function, an organ results; and a group of organs performing a combined function results in the body systems. The eleven primary body systems are the digestive, endocrine, excretory, reproductive, respiratory, circulatory, nervous, lymphatic/immune, muscular, skeletal, and integumentary.
