Nutrition and Growth D.B. Jelliffe, E.F.P. Jelliffe, 2012-12-06 The science of nutrition has advanced beyond expectation since Antoine La voisier as early as the 18th century showed that oxygen was necessary to change nutrients in foods to compounds which would become a part of the human body He was also the first to measure

metabolism and to show that oxidation within the body produces heat and energy In the two hundred years that have elapsed the essentiality of nitrogen containing nutrients and of proteins for growth and maintenance of tissue has been established the necessity for carbohydrates and certain types of fat for health has been documented vitamins necessary to prevent deficiency diseases have been identified and isolated and the requirement of many mineral elements for health has been demonstrated Further investigations have defined the role of these nutrients in metabolic processes and quantitated their requirements at various stages of development Additional studies have involved their use in the possible prevention of and therapy for disease conditions

Human Growth F. Falkner, 2013-06-29 Growth as we conceive it is the study of change in an organism not yet mature Differential growth creates form external form through growth rates which vary from one part of the body to another and one tissue to another and internal form through the series of time entrained events which build up in each cell the specialized complexity of its particular function We make no distinction then between growth and development and if we have not included accounts of differentiation it is simply because we had to draw a quite arbitrary line somewhere It is only rather recently that those involved in pediatrics and child health have come to realize that growth is the basic science peculiar to their art It is a science which uses and incorporates the traditional disciplines of anatomy physiology biophysics biochemistry and biology It is indeed a part of biology and the study of human growth is a part of the curriculum of the rejuvenated science of Human Biology What growth is not is a series of charts of height and weight Growth standards are useful and necessary and their construction is by no means void of intellectual challenge They are a basic instrument in pediatric epidemiology But they do not appear in this book any more than clinical accounts of growth disorders This appears to be the first large handbook in three volumes devoted to Human Growth
