ABSTRACT: The durability of concrete slabs strengthened by bonded composite materials has been investigated in the framework of an international cooperation between two French and Japanese research institutes. Time evolution of the concrete/composite adhesive bond strength was studied under both controlled and environmental ageing conditions, by using different mechanical characterization methods. The first results of this ongoing experimental campaign are presented.

1 INTRODUCTION

Composite materials are commonly used worldwide for the strengthening and repair of civil structures. In Japan for instance, strengthening methods based on fibre reinforced polymer (FRP) have been intensively used for the seismic retrofit of bridge columns after the 1995 Kobe earthquake (Saito 2002), whereas in France, such methods are increasingly applied to the rehabilitation or upgrading of damaged concrete structures (Luyckx 1999). If the effectiveness of FRP strengthening techniques has been clearly demonstrated and is now commonly accepted, the durability of the adhesive bond at the concrete/composite interface is still a matter of investigation (Karbhari 2007, Marouani et al. 2008).

Several authors have reported substantial decreases in the adhesive bond strength of FRP strengthened concrete specimens submitted to accelerated ageing conditions, such as freeze-thaw/dry-heat cycles, immersion in salt solutions or exposure to humid environments (Karbhari 2007, Grace & Singh 2005). Saturated humidity was often found to be the most detrimental factor to the adhesive bond properties (Grace & Singh 2005). Beside the abundant laboratory studies, there are only few available data on the effect of long-term environmental ageing. Moreover there is still no reliable method to assess the field degradation rate on the basis of controlled laboratory exposures.

In this paper, the first results of two ongoing studies conducted by the French and Japanese Public Works Research Institutes (LCPC and PWRI, respectively) are presented. On the French side, concrete slabs strengthened by carbon fibre reinforced polymer (CFRP) have been exposed to accelerated laboratory ageing in saturated humidity. Time evolution of the adhesive bond strength was monitored by using either pull-off or shear loading tests. On the Japanese side, similar kind of specimens have been exposed to environmental ageing in the Tokyo City area for 14 years, and the residual adhesive strength was then evaluated by pull-off or peeling tests.

Data provided by these two complementary studies will offer a unique opportunity to compare the effects of laboratory and environmental ageing on the properties of the concrete/composite interface, and to discuss the validity of the various adhesive test methods.

2 EFFECTS OF ACCELERATED AGEING

The French Public Works Research Institute (LCPC) has selected specific laboratory ageing conditions for the durability assessment of adhesive joints: specimens are exposed to 95% relative humidity at a temperature of 40°C in a climatic chamber. Such a humid environment is supposed to be detrimental for the concrete/composite interface, since it may induce both plasticization

Concrete Repair, Rehabilitation and Retrofitting II Mark G. Alexander, Hans-Dieter Beushausen, Frank Dehn, Pilate Moyo, 2008-11-13 The Second International Conference on Concrete Repair Rehabilitation and Retrofitting ICCRRR 2005 was held in Cape Town South Africa from 24-26 November 2008. The Conference followed the very successful First International Conference also in Cape Town in 2005 and continued as a collaborative venture by researchers from the South African Research Programme in Concrete Materials based at the Universities of Cape Town and The Witwatersrand and The Construction Materials Sections at Leipzig University and MFPA Leipzig in Germany. The background in industry and the state of national infrastructures continues to be highly challenging and demanding. The facts remain that much of our concrete infrastructure deteriorates at unacceptable rates that we need appropriate tools and techniques to undertake the vast task of sound repair, maintenance and rehabilitation of such infrastructure and that all this must be undertaken with due cognisance of the limited budgets available for such work. New ways need to be found to extend the useful life of concrete structures cost effectively. Confidence in concrete as a viable construction material into the 21st century needs to be retained and sustained, particularly considering the environmental challenges that the industry and society now face. The conference proceedings contain papers presented at the conference and classified into a total of 12 sub-themes which can be grouped under the three main themes of: i) Concrete durability aspects; ii) Condition assessment of concrete structures; and iii) Concrete repair, rehabilitation and retrofitting. The major interests in terms of submissions exist in the fields of innovative materials for durable concrete construction, integrated service life modelling of reinforced concrete structures, NDE, NDT and measurement techniques, repair methods and materials, and structural strengthening and retrofitting techniques. The large number of high quality papers presented and the wide range of relevant topics covered confirm that these proceedings will be a valued reference for many working in the important fields of concrete durability and repair and that they will form a suitable base for discussion and provide suggestions for future development and research.
