Parametric State Space Structuring Gianfranco Ciardo, Institute for Computer Applications in Science and Engineering, 1997 Abstract Structured approaches based on Kronecker operators for the description and solution of the infinitesimal generator of a continuous time Markov chains are receiving increasing interest However their main advantage a substantial reduction in the memory requirements during the numerical solution comes at a price Methods based on the potential state space allocate a probability vector that might be much larger than actually needed Methods based on the actual state space instead have an

additional logarithmic overhead We present an approach that realizes the advantages of both methods with none of their disadvantages by partitioning the local state spaces of each submodel We apply our results to a model of software rendezvous and show how they reduce memory requirements while at the same time improving the efficiency of the computation
