Table 5. An example of what the DMN focuses on during each episode on a real query in the hAbI task. Darker colors mean that the attention weight is higher.

Figure 4. Attention weights for sentiment examples that were only labeled correctly by a DMN with two episodes. The y-axis shows the episode number. This sentence demonstrates a case where the ability to iterate allows the DMN to sharply focus on relevant words.

ule to perform multiple passes over the data is beneficial. It provides significant benefits on harder hAbI tasks, which require reasoning over several pieces of information or transitive reasoning. Increasing the number of passes also slightly improves the performance on sentiment analysis, though the difference is not as significant. We did not attempt more iterations for sentiment analysis as the model struggles with overfitting with three passes.

Figure 5. These sentence demonstrate cases where initially positive words lost their importance after the entire sentence context became clear either through a contrastive conjunction ("but") or a modified action "best described."

5. Conclusion

The DMN model is a potentially general architecture for a variety of NLP applications, including classification, question answering and sequence modelling. A single architecture is a first step towards a single joint model for multiple NLP problems. The DMN is trained end-to-end with one, albeit complex, objective function. Future work will explore additional tasks, larger multi-task models and multimodal inputs and questions.
