Sherali, W. P. Adams, 2013-04-17 This book deals with the theory and applications of the Reformulation Linearization Convexification Technique RL T for solving nonconvex optimization problems A unified treatment of discrete and continuous nonconvex programming problems is presented using this approach In essence the bridge between these two types of nonconvexities is made via a polynomial representation of discrete constraints For example the binariness on a 0 1 variable x can be equivalently expressed as the polynomial constraint $x^2 - x = 0$ The motivation for this book is the role of tight linear convex programming representations or relaxations in solving such discrete and continuous nonconvex programming problems The principal thrust is to commence with a model that affords a useful representation and structure and then to further strengthen this representation through automatic reformulation and constraint generation techniques As mentioned above the focal point of this book is the development and application of RL T

for use as an automatic reformulation procedure and also to generate strong valid inequalities The RLT operates in two phases In the Reformulation Phase certain types of additional implied polynomial constraints that include the aforementioned constraints in the case of binary variables are appended to the problem The resulting problem is subsequently linearized except that certain convex constraints are sometimes retained in XV particular special cases in the Linearization Convexification Phase This is done via the definition of suitable new variables to replace each distinct variable product term The higher dimensional representation yields a linear or convex programming relaxation **The Shock and Vibration**
