Auditors can use process mining techniques to evaluate all events in a business process, and do so while it is still running.

Auditors validate information about organizations and their business processes. Reliable information is needed to determine whether these processes are executed within certain boundaries set by managers, governments, and other stakeholders. Violations of specific rules enforced by law or company policies may indicate fraud, malpractice, risks, or inefficiencies.

Traditionally, an audit can only provide reasonable assurance that business processes are executed within the given set of boundaries. Auditors assess the operating effectiveness of process controls, and when these controls are not in place or functioning as expected, they typically check samples of factual data.

However, with detailed information about processes increasingly available in high-quality event logs, auditors no longer have to rely on a small set of samples offline. Instead, using process mining techniques, they can evaluate all events in a business process, and do so while it is still running.

The omnipresence of electronically recorded business events

coupled with process mining technology enable a new form of auditing that will dramatically change the role of auditors: Auditing 2.0.

PROCESS MINING

The goal of process mining is to discover, monitor, and improve real (not assumed) processes by extracting knowledge from event logs. Over the past decade, process mining techniques have matured and are being integrated into commercial software products (W.M.P. van der Aalst et al., "Business Process Mining: An Industrial Application," *Information Systems*, vol. 32, no. 5, 2007, pp. 713-732).

Business provenance

Process mining starts with the event log: a sequentially recorded collection of events, each of which refers to an activity (well-defined step) and is related to a particular case (process instance). Some mining techniques use other information such as the person or resource executing or initiating the activity, the event's time stamp, or data elements recorded with the event—for example, the size of an order.

The systematic, reliable, and trustworthy recording of events, known as *business provenance*, is essential to auditing. This term acknowledges the importance of traceability by ensuring that history cannot be rewritten or obscured.

Process discovery

By analyzing frequent patterns, process mining techniques can extract from event logs models that describe the processes at hand. For example, the Alpha process mining algorithm can automatically extract a Petri net that concisely models behavior in the event log. This gives the auditor an unbiased view of what has actually happened.

Conformance checking

An auditor can use an a priori process model to check if reality, as recorded in the event log, conforms to the model and vice versa. For example, a model may indicate that purchase orders exceeding one million euros require two checks. Auditors can use conformance checking to detect deviations, locate and explain them, and measure their severity (A. Rozinat and W.M.P. van
