

Standard Test Method for Consolidated Drained Triaxial Compression Test for Soils¹

This standard is meant solely for use in conjunction with the ASTM International Catalogue of Standards published for sale or subject adoption as is the case of voluntary the use of this subject, it remains the responsibility of the user of this subject to determine whether it fulfills any regulatory or contractual obligations or regulatory or contractual obligations.

1. Scope

1.1 This test method covers the determination of strength and stress-strain relationships of a cylindrical specimen of either intact or remolded soil. Specimens are consolidated and drained in compression with drainage at a constant rate of axial deformation (strain controlled).

1.2 This test method provides for the calculation of principal stresses and axial compression by measurement of axial load, axial deformation, and volume change.

1.3 This test method provides data useful in describing strength and deformation properties such as Mohr strength envelopes. Generally, three specimens are tested at different effective confining stresses to define a strength envelope.

1.4 If this test method is used on cohesive soil, a test may take weeks to complete.

1.5 The determination of strength envelopes and the development of relationships to soil or subsurface and evaluation are beyond the scope of this test method and must be performed by a qualified experienced professional.

1.6 All values of soil parameters shall conform to the guidelines for significant digits and rounding established in Practice D6966.

1.6.1 The methods used to specify how data are collected, tabulated, or recorded in this standard are regarded as the industry standard. In addition, there are recommendations of the significant digits that generally should be retained. The user must not consider statistical variations, proper for analyzing the data, exceed proper rounding or any combination of the two. It is beyond the scope of this test method to consider significant digits used in analysis methods for engineering design.

1.7 Notes—The notes listed in 8.1 apply to be regarded as standard. The test method shall give in parentheses, for nonstandard conversions, which are provided for information purposes only and are not considered standard. Improving of

test results in units other than SI shall not be regarded as non-conformance with this test method.

1.7.1 The international system of units (SI) shall be used when dealing with this test method. In this system, the pound (lbf) represents a unit of force (weight), while the unit for mass is slug. The slug unit is not given, unless density (ρ) is also determined and checked.

1.7.2 It is common practice in the geotechnical engineering profession to commonly use pounds as representing both a unit of mass (force) and of force (lbf). This typically involves two separate systems of units, that is, the absolute system and the gravitational system. It is internationally undesirable to maintain the use of two separate sets of units (pound mass within a single standard). As noted, this method includes the gravitational system of units (pound mass) and does not implement the slug unit for mass. However, the use of pounds as units representing pounds of mass (force) or representing density in (lbf/ft³) shall not be regarded as non-conformance with this method.

1.7.3 The term density and unit weight are often used interchangeably. Density is mass per unit volume whereas unit weight is force per unit volume. In this standard density is given only in SI units. When the density has been determined, the unit weight is calculated in SI or both (pound mass, or both).

1.8 This standard may involve hazardous materials, operations, and equipment. This standard does not purport to address all of the safety concerns of any particular work site. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.
