Question 2: The next page contains a diagram depicting a “half-eye” view of the sky. Note that it is drawn like a sky-chart, which is held up above your head and minimizes the sky from that perspective. You can convince yourself that the east and west directions are shown correctly by looking up at the diagram while holding it above your head.

Measure	H_0 (invariance)	H_1 (noninvariance)
(A)	0°	200°
(B)	100°	0°
(C)	1000°	-100°

Assume that you are at latitude 40° N, which is the approximate latitude of Spokane. When making predictions about the future locations of stars A, B, and C, use the sky chart diagram on the next page. Remember that the sky appears to rotate around the NCP, which is a point at altitude $\approx 40^{\circ}$, azimuth $\approx 0^{\circ}$ in the diagram (as seen from Spokane). Try making your predictions first, and then use an active star within the Northern Diagram view simulation to check (and correct) your answers.

- (c) **Mark and label** the location of the North Celestial Pole. Since this location is directly above Earth's North Pole, it will not move as Earth rotates. **Draw and label** a circle around the NCP that represents the circumpolar region of the sky.

What are the 100N coordinates of star A, at $t = 1.0$ second? **ANSWER:** $x = 0$.

Revised: 20th November 2017, 16:00:00, 12/10/17

For what direction of the day is star A visible before the horizon? **NE**

Draw and label a circle representing this star's motion over the course of a day.
