Scientists from many disciplines require making observations which are dependent upon the behavior of compounds in solution This ranges from areas in geography such as oceanography to areas in chemistry such as chromatography to areas in biology such as pharmacology Historically information would be obtained by observing a response for a given set of conditions and then the conditions would be changed and a new response obtained In this approach there would be little effort made to actually understand how a compound was behaving in solution but rather just the response was noted Understanding the behavior of compounds in solution is critical to understanding their behavior in biological systems This has become increasingly important during the last twenty years as an understanding of the biochemistry related to human

illness has become better understood The development of the pharmaceutical industry and the need to rapidly screen large numbers of compounds has made scientists in the area of drug development aware that the pharmacological activity of compounds can be predicted by knowing their solution physical chemical properties This is not to say that a specific drug active site interaction can be predicted but rather a prediction can be made whether or not a compound will be absorbed transported or distributed within a physiological system in such a way that an interaction can occur
