PID Controller Design Approaches Marialena Vagia, 2012-03-28 First placed on the market in 1939 the design of PID controllers

remains a challenging area that requires new approaches to solving PID tuning problems while capturing the effects of noise and process variations. The augmented complexity of modern applications concerning areas like automotive applications, microsystems technology, pneumatic mechanisms, dc motors, industry processes, require controllers that incorporate into their design important characteristics of the systems. These characteristics include but are not limited to model uncertainties, system's nonlinearities, time delays, disturbance rejection requirements, and performance criteria. The scope of this book is to propose different PID controllers designs for numerous modern technology applications in order to cover the needs of an audience including researchers, scholars, and professionals who are interested in advances in PID controllers and related topics.

Microprocessor-Based Control Systems N.K. Sinha, 1986-06-30. Recent advances in LSI technology and the consequent availability of inexpensive but powerful microprocessors have already affected the process control industry in a significant manner. Microprocessors are being increasingly utilized for improving the performance of control systems and making them more sophisticated as well as reliable. Many concepts of adaptive and learning control theory which were considered impractical only 20 years ago are now being implemented. With these developments there has been a steady growth in hardware and software tools to support the microprocessor in its complex tasks. With the current trend of using several microprocessors for performing the complex tasks in a modern control system, a great deal of emphasis is being given to the topic of the transfer and sharing of information between them. Thus the subject of local area networking in the industrial environment has become assumed great importance. The object of this book is to present both hardware and software concepts that are important in the development of microprocessor based control systems. An attempt has been made to obtain a balance between theory and practice with emphasis on practical applications. It should be useful for both practicing engineers and students who are interested in learning the practical details of the implementation of microprocessor based control systems. As some of the related material has been published in the earlier volumes of this series, duplication has been avoided as far as possible.

Design and Implementation of PID Controller for DC Motor Using PIC Mohd Hafiz Omar, 2009. The purpose of this study is to control the speed of direct current DC motor with PID controller using Proportional Integral Derivative PID. The PID Controller will be design and must be tune so the comparison between simulation result and experimental result can be made. The scopes includes the simulation and modeling of direct current DC motor implementation of Proportional Integral Derivative PID Controller into actual DC motor and comparison of MATLAB simulation result with the experimental result. This research was about introducing the new ability of in estimating speed and controlling the permanent magnet direct current PMDC motor. In this project PID Controller will be used to control the speed of DC motor. The PID Controller will be programmed to control the speed of DC motor at certain speed level. The sensor will be used to detect the speed of motor. Then the result from sensor is fed back to PIC to find the comparison between the desired output and measured output to get the estimating speed.

This includes nonlinear plant models that the reader can use for other projects and research work. Presents application problems with solutions to help reinforce the information learned.

PID Digital Controller for DC Motor Speed Using MC68HC11 Microcontroller Sharon Peterus, 2008. The proportional integral derivative PID controllers are widely used in many industrial control systems for several decades since Ziegler and Nichols proposed their first PID tuning method. This is because the PID controller structure is simple and its principle is easier to understand than most other advanced controllers. On the other hand, the general performance of PID controller is satisfactory in many applications. For these reasons, the majority of the controllers used in industry are of PI/PID type. PID controllers are widely used for process control applications requiring very precise and accurate control. The purpose of the motor speed controller is to take a signal representing the demanded speed and to drive a motor at that speed. The controller does not actually measure the speed of the motor. Thus it is called an Open Loop Speed Controller. Motors come in a variety of forms and the speed controller's motor drive output will be different dependent on these forms. The speed controller presented here is designed to drive special dc motor which is not easily available anywhere in store, thus it is a good example to be used due to the special characteristics and parameters. Matlab/Simulink is an important tool used in this project from designing the mathematical model of the dc motor, obtaining the transfer function and designing the PID controller using both model and programming using m-files. The transfer function will be linearized and used for tuning the gain of PID controller like K_P , K_I and K_D . Simulink is chosen to simulate the performance of the control system.
