Handbook Of Pattern Recognition And Computer Vision (5th Edition) Chi Hau Chen,2015-12-15 Pattern recognition

image processing and computer vision are closely linked areas which have seen enormous progress in the last fifty years. Their applications in our daily life, commerce and industry are growing even more rapidly than theoretical advances. Hence the need for a new handbook in pattern recognition and computer vision every five or six years as envisioned in 1990 is fully justified and valid. The book consists of three parts: 1. Pattern recognition methods and applications, 2. Computer vision and image processing, and 3. Systems architecture and technology. This book is intended to capture the major developments in pattern recognition and computer vision though it is impossible to cover all topics. The chapters are written by experts from many countries, fully reflecting the strong international research interests in the areas. This fifth edition will complement the previous four editions of the book.

Medical Biometrics: Computerized Tcm Data Analysis David Zhang, Wangmeng Zuo, 2016-02-23. The introduction of traditional Chinese medicine (TCM) through modern information technology will not only achieve the objective progress of the heritage of thousands of years of TCM but also deliver novel discoveries for modern medicines. This book is an advanced monograph based on a decade's worth of research work by the authors. After a brief introduction on the four diagnosis approaches in TCM, this book delves into the three main TCM data analysis techniques: computerized tongue pulse and odor analysis. Both graduate students and researchers in computerized TCM data analysis will benefit from the book as it will provide a comprehensive understanding of the state of the art analysis methods, image signal acquisition devices, and the related feature extraction and classification methods.

Object Representation and Matching Based on Skeletons and Curves Christian Feinen, 2016-05-31. This thesis is dedicated to the problem of object recognition in the three dimensional space. Instead of using exclusively the information typically transported by a two dimensional image, the concept of this work additionally incorporates the third dimension, namely the depth. The depth data itself is captured by sensors capable of measuring the distance from the device's position to those

objects residing inside its field of view The actual recognition process is implemented in analogy to the Path Similarity Skeleton Graph Matching PSSGM Basically this method represents a 2D object by its skeleton and uses the idea of shortest paths to describe it Finally the similarity between two objects is calculated based on the Hungarian method The contribution of the current work maps this approach into the three dimensional space and applies it to 3D objects While one of the experiments aims at the recognition of 3D chairs and tables another one is devoted to the registration of fully segmented vascular structures Excellent and promising recognition results are achieved in challenging evaluation setups showing that the 3D version of the PSSGM has the potential to solve complex recognition tasks
