Dimensioning Of Lte Network Aalto:

LTE-A Cellular Networks Abid Yahya, 2016-09-02 In this book three different methods are presented to enhance the capacity and coverage area in LTE A cellular networks. The scope involves the evaluation of the effect of the RN location in terms of capacity and the determination of the optimum location of the relay that provides maximum achievable data rate for users with limited interference at the cell boundaries. This book presents a new model to enhance both capacity and coverage area in LTE A cellular network by determining the optimum location for the RN with limited interference. The new model is designed to enhance the capacity of the relay link by employing two antennas in RN. This design enables the relay link to absorb more users at cell edge regions. An algorithm called the Balance Power Algorithm BPA is developed to reduce MR power consumption. The book pertains to postgraduate students and researchers in wireless mobile communications. The Telecommunications Handbook Jyrki T. J. Penttinen, 2015-01-13 THE TELECOMMUNICATIONS HANDBOOK ENGINEERING GUIDELINES FOR FIXED MOBILE AND SATELLITE SYSTEMS Taking a practical approach The Telecommunications Handbook examines the principles and details of all the major and modern telecommunications systems currently available to industry and to end users. It gives essential information about usage architectures functioning planning construction measurements and optimization. Dimensioning and Performance of Networks Seppo J. Halme, 1995

A Network Dimensioning Tool Dimitris Alevras, Martin Grötschel, Roland Wessäly, 1996

Abstract Designing low cost networks that survive certain failure situations belongs to one of the prime tasks in the telecommunications industry In this paper we describe a mathematical model integrating several aspects of survivability that are elsewhere treated in a hierarchical fashion We present mathematical investigations of this model a cutting plane algorithm as well as several heuristics for its solution Moreover we report computational results with real world data The problem we address is the following Suppose between each pair of nodes in a region a communication demand is given We want to determine the topology of a telecommunication network connecting the given nodes and to dimension all potential physical links For each link the possible capacities are restricted to a given finite set The capacities must be chosen such that the communication demands are satisfied even if certain network components fail and such that the network building costs are as small as possible Moreover for each pair of nodes and each failure situation we want to determine the paths on which the demand between the nodes is routed
