

Redshift - light moves towards red end of the spectrum

Speed of Galaxies

- Speed of galaxies AND amount by which light from a galaxy is
 - ...may be determined by measuring the change in wavelength of light coming from that galaxy.

- λ_0 = the wavelength of light for a stationary observer (reference wavelength, measured in lab) → when it was emitted BEFORE it was red-shifted
- λ is the measured wavelength
- $\Delta \lambda$ is the change in wavelength
- speed of light = $3.00 \times 10^9 \, m/s$

Speed of Galaxy related to its distance

Hubble discovered that the speed of a galaxy is proportional to its distance from us

8.17P describe the red-shift in light received from galaxies at different distances away from the Earth

The Red-shift of GALAXIES

 The light coming to us from distant galaxies is redshifted (they are moving AWAY from us)

- Furthermore, the greater the distance to the galaxy, the greater the redshift
 - The more distant galaxies are moving away from us faster

Light from Galaxies is RED-SHIFTED

Most galaxies seem to be moving away from each other, because:

- Different elements absorb different frequencies (OR wavelengths) of light
- 2. When light is passed through a sample of an element, a pattern of dark lines is produced - with a dark line at each of the frequencies in the visible part of the EM spectrum that the element absorbs
- 3. When we look at light from distant galaxies, we see the SAME
 - patterns BUT at slightly lower frequencies (and so lower wavelengths) than they should be
- 4. Patterns have been shifted towards the red end of the spectrum red-shift

8.18P explain why the red-shift of galaxies provides evidence for the expansion of the universe

Measurements of the red-shift suggest that ALL the distant galaxies are MOVING AWAY from Earth very quickly - same result in whichever direction you look in

distant galaxy. The disk lines in this spectrum are red-shifted
