Abstract: With the rapid development of multimedia and computer technology, images, audio, text and video can be more easily produced, processed as well as stored by digital devices in recent years. To conceal data in transmitting message for preventing the illegal copying or to protect the secret is very important. Data encryption and information hiding schemes are developed to protect the secret data. In this paper, digital image watermarking algorithm based on DWT, DCT and SVD has been proposed in which Arnold transform has been applied to watermark image in order to ensure the watermark robustness. Experimental results show the algorithm is robust to the common image process such as JPEG compression and other attacks like noise and filters.

Keywords: DCT, DWT, SVD, PSNR, MSE, NC.

I. INTRODUCTION

Since Internet is a public transmission way and it is widely applied in many applications, we can send and receive digital data, such as images, by connected networks, with the recent growth of communication technologies. At the end of the 20th century, information network technology was widely used all over the world and it was greatly convenient for resource sharing and exchange between people. However, it was followed by many serious problems. However, many new issues such as security of digital information transmission and copyright protection of digital products also emerge in the meantime. How to prevent digital products from copyright infringement, piracy and alteration without permission have become many nations' concerns needing to be resolved urgently. Data encryption methods make the secret data into meaningless bits. On the other hand, information hiding techniques hides the message into a meaningful multimedia data.

Watermarking is the process of embedding data into a multimedia element such as an image, audio or video file for the purpose of authentication. This embedded data can later be extracted from, or detected in, the multimedia for security purposes. A watermarking algorithm consists of the watermark structure, an embedding algorithm, and an extraction or detection algorithm. Watermarks can be embedded in the pixel domain or a transform domain. In multimedia

applications, embedded watermarks should be invisible, robust, and have a high capacity. In the classification of watermarking schemes, an important criterion is the type of information needed by the detector. The requirements for digital watermarks in these scenarios are different, in general. Identification of the origin of content requires the embedding of a single watermark into the content at the source of distribution. To trace illegal copies, a unique watermark is needed based on the location or identity of the recipient in the multimedia network. In both of these applications, non-blind schemes are appropriate as watermark extraction or detection needs to take place in special laboratory environment only when there is a dispute regarding the ownership of content.

II. NEED OF WATERMARKING

Watermarking methods are based on the human visual system in which it cannot be recognized due to tiny difference. In these techniques, the cover-image is used to hide the secret information and the stego-image is the cover-image with the secret data embedded inside. It hides the secret information in general files secretly first and then transmits these files through network, because they look the same as general files, they can escape from the attention of illegal interceptors easily and therefore the secret information is not easy to be attacked.

III. WORKING DOMAINS

Currently, there are two most popular digital watermarking technologies including the Methods in Time Domain and Methods in Transformation Domain. Methods in the former one can be implemented more simply, but the robustness is poorer, while methods in the latter one are more popular with their stronger anti-attack functions. The typical Transformation-Domain Methods are mostly based on the domain of Discrete Fourier Transform (DFT), Discrete Cosine Transform (DCT) and Discrete Wavelet Transform (DWT), etc. Recently, some researchers began to make use of Singular Value Decomposition (SVD) to embed a watermark[1]. SVD is a compression technique that can be used in a wide range of applications where data may be organized in a matrix representation. With the increasing use of SVD, the digital watermarking
