Exploration and Production of Oceanic Natural Gas Hydrate Michael D. Max, Arthur H. Johnson, 2018-10-24 This second edition provides extensive information on the attributes of the Natural Gas Hydrate NGH system highlighting opportunities for the innovative use and modification of existing technologies as well as new approaches and technologies that have the potential to dramatically lower the cost of NGH exploration and production Above all the book compares the physical environmental and commercial aspects of the NGH system with those of other gas resources It subsequently argues and demonstrates that natural gas can provide the least expensive energy during the transition to and possibly within a renewable energy future and that NGH poses the lowest environmental risk of all gas resources Intended as a non mathematical descriptive text that should be understandable to non specialists as well as to engineers concerned with the physical characteristics of NGH reservoirs and their production the book is written for readers at the university graduate level It offers a valuable reference guide for environmentalists and the energy community and includes discussions that will be of great interest to energy industry professionals legislators administrators regulators and all those concerned with energy options and their respective advantages and disadvantages

**Coiled Tubing Drilling with Supercritical Carbon Dioxide**, 2002 A method for increasing the efficiency of drilling operations by using a drilling fluid material that exists as supercritical fluid or a dense gas at temperature and pressure conditions existing at a drill site The material can be used to reduce mechanical drilling forces to remove cuttings or to jet erode a substrate In one embodiment carbon dioxide CO sub 2 is used as the material for drilling within wells in the earth where the normal temperature and pressure conditions cause CO sub 2 to exist as a supercritical fluid Supercritical carbon dioxide SC CO sub 2 is preferably used with coiled tube CT drilling equipment The very low viscosity SC CO sub 2 provides efficient cooling of the drill head and efficient cuttings removal Further the diffusivity of SC CO sub 2 within the pores of petroleum formations is significantly higher than that of water making jet erosion using SC CO sub 2 much more effective than water jet erosion SC CO sub 2 jets can be used to assist mechanical drilling for erosion drilling or for scale removal A choke manifold at the well head or mud cap drilling equipment can be used to control the pressure within the borehole to ensure that the temperature and pressure conditions necessary for CO sub 2 to exist as either a supercritical fluid or a dense gas occur at the drill site Spent CO sub 2 can be vented to the atmosphere collected for reuse or directed into the formation to aid in the recovery of petroleum

Following an extensive study by Deep Exploration Technologies Cooperative Research Centre DET CRC on the available drilling technologies in the market coiled tube technology was suggested as a faster and economic drilling method This is primarily due to its smaller footprint relative to the standard rotary method ease of unit mobility less operating personnel faster rate of penetration and faster rig up and rig down times The conventional steel coiled tube material has traditionally been used in the petroleum industry However cyclic bending of the steel coiled tubing past its yield strength point leads to progressive weakening of the tube hence leading to rapid reduction of its service life
