Handover and Cell Reselection Study in LTE Marta Coll Muñoz, 2011 ANGL S In LTE the handover is a hard handover the UE is first connected to the source eNodeB then it gets unattached to the network to connect again to the target eNodeB This procedure is not fail safe and may cause a call drop In this project the influence of some handover related parameters such as hysteresis margin Time to Trigger antenna

configuration route trajectory and UE parameters is studied to show their impact in the handover performance Simple synthetic scenarios are simulated to evaluate the effect of each parameter on the handover procedure With this analysis we obtain the worst handover conditions for simple scenarios A method to study handovers in a 3D city model is developed using a deterministic prediction tool Ray Tracing With this method we identify problematic areas for handovers inside a real city Finally with the technique developed here some routes in this city with possible call drops due to bad handovers are selected and examined in more detail This study can help operators optimizing their network deployments and also help chip vendors to know in which handover problematic areas their devices can be tested

Analysis of Handover Based on the Use of Femtocells in LTE Networks Ketyllen Silva, Carlos Francês, 2015-08-28 The volume of data traffic in mobile networks is growing exponentially The explosion of mobile devices and applications in recent years has led to an overload of the network infrastructure responsible for disposing of this traffic thus affecting the performance of the network as the user experience One of the key elements in the networks LTE Long Term Evolution is the possibility of deploying multiple femtocells for the improvement of coverage and data rate However arbitrary overlapping coverage of these cells makes the handover mechanism complex and challenging Thus this book proposes a methodology to study the impact of handover in LTE networks with femtocells From a discrete simulation approach the effects of the deployment of femtocells were evaluated This study aimed to measure the impact and correlation of the use of femtocell parameters of QoS Quality of Service and performance indicators handover

Handover Optimisation Using Neural Networks Within LTE Neil Sinclair, 2013 Mobile communication infrastructures are getting more complex with the addition of femtocells into the network architecture Allied with this the increased use of smart phones add strain onto the network because of higher data requirements Femtocells are a useful resource to reduce the demand on the macrocell layer and effective handover management is needed to transfer services to and from each base station The importance of handover management is high within LTE and is included within a use case of Self Organizing Networks Base stations can autonomously decide whether handover should take place and assign the values of relevant parameters Setting relevant parameters effectively requires more delicate attention with femtocells to allow for effective and seamless handover to the macrocell Novel approaches with small amounts of additional signal processing can be utilised to improve handover efficiency In this thesis variations of Self Organising Maps have been implemented Self Organising Maps can be used to learn the locations of the indoor environment from where handover requests have occurred and based on previous experience decide whether to permit or prohibit these handovers Once the neural network has adapted to the indoor environment handover can be optimised in different regions independently while still permitting necessary handover The results of the investigations described within this thesis show that utilising location within the handover process is an effective way to improve handover performance within an indoor environment using an LTE femtocell

Demonstration of an Effective 4G LTE Network Simulator to Analyze Performance and Ensure Reliable Communication Naveen Narasimhaiah, 2015 With the growing population technology is growing without any bounds With these advancements we have reached a footing where we cannot imagine the world without communications This dependability on communications strikes a need for highly reliable and cost effective communication technology from the perspective of the user as well as the service provider Though the 3GPP s Long Term Evolution LTE has been successful to mitigate most of the challenges there arises a need to foresee the cellular network evolution considering various factors like increase in number of users in a particular area urbanization etc and accordingly use the features of LTE to overcome the effects of them before actually deploying the network in the real world This thesis outlines the requirement for an effective 4G LTE simulator that can model the real world cellular network by considering the various effects on a wireless network like fading pathloss number of users and resource allocation It can then explore various aspects of 4G LTE that contributes towards design and analysis of the network performance for various scenarios supporting deployment of the new network for futuristic operation or optimizing the existing network In this study we closely look through a System level LTE Simulator developed by the Institute of Telecommunications of The Vienna University of Technology Austria Using this simulator we study different scheduling schemes to evaluate performance and demonstrate how important the role of scheduling scheme is to overcome network

congestion We study various features of LTE that help in increasing throughput for various traffic models over a network and demonstrate the role of small cells in increasing the overall throughput of the network by comparing with the existing macro cell network Various parameters are varied and results are obtained for various scenarios using the Vienna LTE simulator These results are then used to demonstrate how Quality of Service QoS capacity planning and resource management are achieved through LTE technology This study helps the service provider to offer reliable service at lower implementation cost and deploy a network that has ability to sustain the evolution
