Critical comparison of major seismic codes for buildings fib Fédération internationale du béton, 2013-01-01 fib Bulletin 69 illustrates and compares major buildings seismic codes applied in the different Continents namely U S Japan New Zealand Europe Canada Chile and Mexico Bulletin 69 was prepared by Task Group 7 6 of fib Commission 7 under the leadership of the late Professor Robert Bob Park which in tandem with Professor Paulay had developed in the seventies new fundamental design concepts most notably capacity design approach and structural design for ductility that had made the NZ seismic Code the most advanced one of the time This new approach has highly influenced the development of Eurocode 8 to which Bob Park has significantly contributed Bob Park was also well informed of the situation in Japan USA Canada and South America Such a wide view is reflected in Bulletin 69 showing similarities and differences among the major seismic codes accompanied as far as possible by comments hopefully useful for fostering international harmonization A comprehensive summary of the major codes is provided in the first chapter of the bulletin All codes are separately presented according to a common framework an introduction section which describes the history the philosophy the process development the performance based criteria the strength of materials and the incorporation of strength reduction factors of each code a second section devoted to the demand side which specify the seismic design actions and associated criteria of each code for areas of different seismicity and for structures with different ductility properties requirements a third section devoted to the capacity side which describes the capacities of members and joints and associated criteria of each code including member strengths in flexure shear and bars anchorage desirable hierarchies of strength attainment deformation capacities of mechanisms of inelastic deformation detailing of beams columns and structural walls detailing of beam column joints for shear and the detailing of diaphragms The second chapter is devoted to the comparison of the more significant issues dealt in the considered codes This includes seismic design actions and associated criteria capacity design practice beams columns confinement structural walls and joints It is felt that fib Bulletin 69 represents a useful unique instrument for rapidly gaining an overview of the distinguishing features of the major world codes under both their conceptual framework and application rules

Bulletin of the New Zealand Society for Earthquake Engineering ,2008 Case Studies on Conservation and Seismic Strengthening/Retrofitting of Existing Structures Andreas Lampropoulos, 2020-07-01 Recent earthquakes have demonstrated that despite the continuous developments of novel materials and new strengthening techniques the majority of the existing structures are still unprotected and at high seismic risk The repair and strengthening framework is a complex process and there are often barriers in the preventative upgrade of the existing structures related to the cost of the applications and the limited expertise of the engineers The engineers need to consider various options thoroughly and the selection of the appropriate strategy is a crucial parameter for the success of these applications The main aim of this collection is to present a number of different approaches applied to a wide range of structures with different

characteristics and demands acting as a practical guide for the main repair and strengthening approaches used worldwide This document contains a collection of nine case studies from six different countries with different seismicity i e Austria Greece Italy Mexico Nepal and New Zealand Various types of structures have been selected with different structural peculiarities such as buildings used for different purposes i e school buildings town hall 30 storey office tower a bridge and a wharf Most of the examined structures are Reinforced Concrete structures while there is also an application on a Masonry building For each of the examined studies the local conditions are described followed by the main deficiencies which are addressed The methods used for the assessment of the in situ conditions also presented and alternative strategies for the repair and strengthening are considered *Bulletin of the New Zealand National Society for Earthquake Engineering* ,1997

Volume 2 of the seminar proceedings includes the discussion for the contents of Volume 1 and the main elements of the four codes. Therefore some of the modifications for the trial design of bridge piers in Volume 1 are also included reflecting the discussion at the seminar. Besides these the contents include the numerical evaluation of designed bridge piers which conclude the comparison of the performances of four major seismic design codes as a whole. As appendices the main provisions of the four codes that are used in designing are attached so that the readers of the books will benefit from the convenience of the reference. The overall aim of the International Seminar on Comparative Performances of Seismic Design Codes for Concrete Structures are thus accomplished and we are quite sure that this will help structural engineers who are engaged in seismic design of RC structures to understand the differences of the basic ideas underlying in each of the seismic design code provisions with ease and to make most of those
