Purchasers can usually download a free scanned copy of the original book without typos from the publisher. Not indexed. Not illustrated. 1912 edition. Excerpt step The production of ferric chloride at this point is advantageous in that it dissolves copper oxide, copper sulphide or metallic copper which remained unaffected by the roasting, producing copper chloride and this ferric chloride also maintains the copper chloride in the cupric condition. The gold and silver in the ore are brought into solution by converting all the copper into cupric chloride and then adding a small amount of chlorine, chlorous or chloric compounds. The chlorides of silver and gold being soluble in calcium chloride solutions may afterward be precipitated with the copper and subsequently separated. After leaving the reaction drum the mass of gangue solution and precipitates is subjected to filtration. The solid matter forms a cake which consists of the gangue in the ore except a small amount of iron and alumina which have been taken into solution and the calcium sulphate precipitate already mentioned. The solution comprises a carrier in which has been dissolved the metals to be recovered, a small amount of iron and alumina and any zinc which may have been in the ore. The arsenic will have been separated by filtration as it has been rendered insoluble. The solution is then subjected if necessary to a further oxidizing operation in order to be sure that the metals are all combined at their highest valency. The solution is then in condition for treatment for the separation of the dissolved metals. The precipitation of iron and alumina may be made by cupric oxide hydrate or calcium carbonate and as this precipitate will carry some copper it is returned to the amphydizer or roasting furnace after having been removed from the solution by filtration. In the amphydizer the iron and alumina in the precipitate are **Hydroxyoximes and Copper Hydrometallurgy** Jan Szymanowski, 2022-11-30 Hydroxyoximes and Copper Hydrometallurgy provides a current examination of what is known regarding hydroxyoxime extractants, the chemistry and physicochemistry of extraction and the potential of applying hydroxyoximes for extraction of copper and other metals in industrial processes. Topics addressed include the development of the hydrometallurgical process, methods of synthesis and structural characteristics, extraction properties, losses of active substances and problems associated with environmental pollution, the potential of metal extraction and separation with hydroxyoximes, methods of extraction and stripping that can improve metal separation and recovery, the applications of hydroxyoximes in various membrane processes and industrial processes and equipment used for processing oxide ores and tailing. The book will benefit metallurgists, hydrometallurgists, analytical and physical chemists and researchers in mining industries and solvent extraction The Hydrometallurgy of Copper William Eckert Greenawalt, 2018-10-14 This work has been selected by scholars as being culturally important and is part of the knowledge base of civilization as we know it.
