Three-Dimensional Machine Vision Takeo

Kanade, 1987-03-31 A robot must perceive the three dimensional world if it is to be effective there Yet recovering 3 D information from projected images is difficult and still remains the subject of basic research Alternatively one can use sensors that can provide three dimensional range information directly The technique of projecting light stripes started to be used in industrial object recognition systems as early as the 1970s and time of flight laser scanning range finders became available for outdoor mobile robot navigation in the mid eighties Once range data are obtained a vision system must still describe the scene in terms of 3 D primitives such as edges surfaces and volumes and recognize objects of interest Today the art of sensing extracting features and recognizing objects by means of three dimensional range data is one of the most exciting research areas in computer vision Three Dimensional Machine Vision is a collection of papers dealing with three dimensional range data The authors are pioneering researchers some are founders and others are bringing new excitements in the field I have tried to select milestone papers and my goal has been to make this book a reference work for researchers in three dimensional vision The book is organized into four parts 3 D Sensors 3 D Feature Extractions Object Recognition Algorithms and Systems and Applications Part I includes four papers which describe the development of unique capable 3 D range sensors as well as discussions of optical geometrical electronic and computational issues Mundy and Porter describe a sensor system based on structured illumination for inspecting metallic castings In order to achieve high speed data acquisition it uses multiple light stripes with wavelength multiplexing Case Jalkio and Kim also present a multi stripe system and discuss various design issues in range sensing by triangulation Then numerical stereo camera developed by Altschuler Bae Altschuler Dijak Tamburino and Woolford projects space coded grid patterns which are generated by an electro optical programmable spatial viii PREFACE light modulator Kanade and Fuhrman

present a proximity sensor using multiple LEDs which are conically arranged. It can measure both distance and orientation of an object's surface.

Machine Vision Herbert Freeman, 2012-12-02. *Machine Vision Algorithms Architectures and Systems* contains the proceedings of the workshop Machine Vision Where Are We and Where Are We Going sponsored by the Center for Computer Aids for Industrial Productivity CAIP at Rutgers University and held in April 1987 in New Brunswick New Jersey. The papers review the state of the art of machine vision and sets directions for future research. Topics covered include smart sensing in machine vision, computer architectures for machine vision and range image segmentation. Comprised of 14 chapters, this book opens with an overview of smart sensing strategies in machine vision and illustrates how smart sensing may fit into a general purpose vision system by implementing a flexible modular system called Pipeline Pyramid Machine. The discussion then turns to a hierarchy of local autonomy for processor arrays focusing on the progression from pure SIMD to complete MIMD as well as the hardware penalties that arise when autonomy is increased. The following chapters explore schemes for integrating vision modules on fine grained machines, computer architectures for real time machine vision systems, the application of machine vision to industrial inspection and characteristics of technologies and social processes that are inhibiting the development and/or evolution of machine vision. Machine vision research at General Motors is also considered. The final chapter assesses future prospects for machine vision and highlights directions for research. This monograph will be a useful resource for practitioners in the fields of computer science and applied mathematics.

Machine Vision for Inspection and Measurement Herbert Freeman, 2012-12-02. *Machine Vision for Inspection and Measurement* contains the proceedings of the Second Annual Workshop on Machine Vision sponsored by the Center for Computer Aids for Industrial Productivity CAIP at Rutgers University and held on April 25-26 1988 in New Brunswick New Jersey. The papers explore the application of machine vision to inspection and measurement and cover topics such as the problem of object pose estimation and depth recovery through inverse optics. The use of machine vision techniques in inspection of integrated circuits and semiconductor wafers is also discussed. Comprised of 11 chapters, this book opens with the problem of using fine grained parallel machines for VLSI inspection. The discussion then turns to a variety of real life applications of machine vision including inspection of integrated circuits, semiconductor wafers, TV tube glass and mechanical parts. The use of machine vision to measure the curvature of the human cornea for vision correction and contact lens fitting purposes is also considered. The remaining chapters focus on motion estimation from stereo sequences using orthographic view algorithms, photometric sampling for determining surface shape and reflectance and efficient depth recovery by means of inverse optics. A chapter addresses the question of whether the industry is ready for machine vision and comes up with some optimistic predictions. This monograph will be of interest to practitioners in the fields of computer science and applied mathematics.
