Fig. 7 Efficiency of Several Types of Straight Fins

Extended Surfaces

Heat transfer from a surface can be increased by attaching fins or extended surfaces to increase the area available for heat transfer. A few common fin geometries are shown in Figures 5 to 8. Fins provide a large surface area in a low volume, thus lowering material costs for a given performance. To achieve optimum design, fins are generally located on the side of the heat exchanger with lower heat transfer coefficients (e.g., the air side of an air-to-water coil). Equipment with extended surfaces includes natural- and forced-convection coils and shell-and-tube evaporators and condensers. Fins are also used inside tubes in condensers and dry expansion evaporators.

Fin Efficiency. As heat flows from the root of a fin to its tip, temperature drops because of the fin material's thermal resistance. The temperature difference between the fin and surrounding fluid is therefore greater at the root than at the tip, causing a corresponding variation in heat flux. Therefore, increases in fin length result in proportionately less additional heat transfer. To account for this effect, fin efficiency ϕ is defined as the ratio of the actual heat transferred

Fig. 8 Efficiency of Four Types of Spines

from the fin to the heat that would be transferred if the entire fin were at its root or base temperature:

$$\phi = \frac{q}{hA_s(t_b - t_a)} \quad (6)$$

where q is heat transfer rate into/out of the fin's root, t_a is temperature of the surrounding environment, t_b is temperature at fin root, and A_s is surface area of the fin. Fin efficiency is low for long or thin fins, or fins made of low-thermal-conductivity material. Fin efficiency decreases as the heat transfer coefficient increases because of increased heat flow. For natural convection in air-cooled condensers and evaporators, where the air-side h is low, fins can be fairly large and fabricated from low-conductivity materials such as steel instead of from copper or aluminum. For condensing and boiling, where large heat transfer coefficients are involved, fins must be very short for optimum use of material. Fin efficiencies for a few geometries are shown in Figures 5 to 8. Temperature distribution and fin efficiencies for various fin shapes are derived in most heat transfer texts.

Handbook of Climate Change Mitigation and Adaptation Maximilian Lackner, Baharak Sajjadi, Wei-Yin Chen, 2025-09-26

Now in its 4th extended edition this completely revised and significantly expanded handbook addresses important new research findings and the global need for action related to climate change in its two most relevant aspects mitigation and adaptation. There is a growing consensus that anthropogenic activities have been driving global climate change and the consequence will be catastrophic for civilization. Reducing the 37.1 billion metric tons of CO₂ produced annually 2017 global emissions along with other greenhouse gases particularly methane has become a leading grand challenge and the pursuit of sustainable energy environments and economies is a complex issue affecting the daily life of every citizen. In this 4th edition readers will find new chapters covering the causes and impacts of global warming, the climate change impacts on health, biodiversity and the economy and emerging technologies for climate change mitigation. Particular attention is given to topics such as wildfire threats, ocean acidification, coral bleaching, sea level rise and permafrost thaw. The latest research on sustainable aviation fuels, carbon mineralization and smart cities is also covered in this new edition as well as topics like sustainable building design, climate resistant building materials and sustainable agriculture. The Handbook of Climate Change Mitigation and Adaptation collates information in this multi-disciplinary area providing readers with a comprehensive overview of the scientific background and current and emerging technologies. Intended for an interdisciplinary global audience of researchers and decision makers at universities and in industry it covers climate change models, established mature and promising future technologies and ideas, the impact of climate change strategies for dealing with global warming, the related political frameworks and climate education.

Building Ventilation Mat Santamouris, Peter

Wouters, 2006-06-01 Ensuring optimum ventilation performance is a vital part of building design. Prepared by recognized experts from Europe and the US and published in association with the International Energy Agency's Air Infiltration and Ventilation Centre AIVC, this authoritative work provides organized, classified and evaluated information on advances in the key areas of building ventilation relevant to all building types. Complexities in airflow behaviour, climatic influences, occupancy patterns and pollutant emission characteristics make selecting the most appropriate ventilation strategy especially difficult. Recognizing such complexities, the editors bring together expertise on each key issue. From components to computer tools, this book offers detailed coverage on design, analysis and performance and is an important and comprehensive publication in this field. Building Ventilation will be an invaluable reference for professionals in the building services industry, architects, researchers, including postgraduate students studying building service engineering and HVAC, and anyone with a role in energy efficient building design.
