

The first four are probably the most often encountered, but all are based upon fixed standards of reference. When choosing a standard for each fundamental unit, it is usually of prime consideration to choose a unit that is both accessible and invariable. Throughout history emphasis has been placed on accessibility. Today, however, science and technology require greater precision and thus greater invariability. The International Bureau of Weights and Measures, IBWM, since its inception in 1875, has tried to keep pace with the demands and needs of the world. In pursuing its task, the IBWM at several periodic meetings has dealt with the problems of new definitions of standards of measurement. The table below shows the definitions of some of the most commonly used standards of measurement.

Fundamental Quantity	Standard	Definition
LENGTH	METER	Original 1/10,000,000 of the distance from the North Pole to the equator measuring along the meridian passing through Paris
		Present The length of a path traveled by light in vacuum during a time interval of 1/299,792,458 of a second
MASS	KILOGRAM	Original Mass of one cubic decimeter of water at its maximum density at a temperature of 4° Celsius
		Present The platinum-iridium international prototype of a kilogram of mass kept at Sevres, France
TIME	SECOND	Original 1/86,400 of the mean solar day
		Present The duration of 9,192,631,770 cycles of the frequency of radiation corresponding to the transition between two specific energy levels of the isotope of cesium 133
TEMPERATURE	DEGREE CELSIUS (100 DIVISION)	Original 1/100 of the interval between the freezing point and boiling point of water
		Present 1/273.15 of the thermodynamic temperature of the triple point of water

To establish derived units of measurement combinations of the fundamental units of measurement are used. For example, when considering speed one must measure the unit of length, the distance traveled along a path, and the unit of time, the time required to travel along the path. Speed is determined by dividing the unit of distance by the unit of time. Thus, the fundamental units of measurement of length and time are used to establish the derived unit of measurement of speed. The following are examples of derived units of measurements.

$$\text{Speed} = \frac{\text{length}}{\text{time}} = \frac{\text{meter}}{\text{second}} \text{ or } \frac{\text{m}}{\text{sec}}$$

$$\text{Density} = \frac{\text{mass}}{\text{volume}} = \frac{\text{kilogram}}{\text{meter}^3} \text{ or } \frac{\text{kg}}{\text{m}^3}$$

A great advantage of the metric system lies in the logical manner the units are related to each other. The metric system was designed to be a decimal system. That is, it is based upon multiples

of ten. This basis is somewhat similar to our monetary system. It is ironic that our forefathers in the United States elected to use a simplified system for our monetary system, but rejected a similar system for its standards of measurement. Because the metric system is a decimal system, any larger or smaller unit is related or changed to any other unit by a simple decimal change. The table below illustrates the prefixes, symbols, and powers of ten signified by each unit. The table shows a large range of prefixes, but the most often encountered are the kilo, centi, and milli.

TABLE OF PREFIXES IN THE METRIC SYSTEM

Prefix	Symbol	Signifies	Powers of Ten
kilo	K	1,000,000,000,000	10^{12}
giga	G	1,000,000,000	10^9
mega	M	1,000,000	10^6
kilo	k	1,000	10^3
hecto	h	100	10^2
deka	da	10	10^1
UNIT EXAMPLES: Meter (m), Gram (g), Second (sec)			
deci	d	0.1	10^{-1}
centi	c	0.01	10^{-2}
milli	m	0.001	10^{-3}
micro	μ	0.000001	10^{-6}
nano	n	0.000000001	10^{-9}
pico	p	0.000000000001	10^{-12}

At times tasks we are requested to perform and things we are asked to learn seem to have no meaning and importance. This may appear true regarding the metric system. Learning the metric system appears difficult for a beginner and unnecessary because of the uncertainty the future holds for the metric system's role in our lives. Yet, once the metric system is learned the knowledge is never lost and its simplicity and value will grow.

QUESTIONS:

- The first requirement necessary for learning the metric system is to recognize and be able to use the prefixes of the metric system. Complete the following parts a - e of this question.

- For each prefix below give its mathematical equivalent as shown in the example.

Example: hecto = 100 = 10^2

milli = _____ = _____

mega = _____ = _____

kilo = _____ = _____

deci = _____ = _____

centi = _____ = _____

giga = _____ = _____
