Robustness in Automatic Speech Recognition Jean-Claude Junqua, Jean-Paul Haton, 2012-12-06 Foreword Looking back the past 30 years we have seen steady progress made in the area of speech science and technology. I still remember the excitement in the late seventies when Texas Instruments came up with a toy named Speak and Spell which was based on a VLSI chip containing the state of the art linear prediction synthesizer. This caused a speech technology fever among the electronics industry. Particularly applications of automatic speech recognition were rigorously attempted by many companies some of which were start ups founded just for this purpose. Unfortunately it did not take long before they realized that automatic speech recognition technology was not mature enough to satisfy the need of customers. The fever gradually faded away. In the meantime constant efforts have been made by many researchers and engineers to improve the automatic speech recognition technology. Hardware capabilities have advanced impressively since that time. In the past few years we have been witnessing and experiencing the advent of the Information Revolution. What might be called the second surge of interest to commercialize speech technology as a natural interface for man machine communication began in much better shape than the first one. With computers much more powerful and faster many applications look realistic this time. However there are still tremendous practical issues to be overcome in order for speech to be truly the most natural interface between humans and machines.
