Herta Flor and Dennis Turk have contributed greatly in their careers to the expansion of research in chronic pain and psychology. In *Chronic Pain: An Integrated Biobehavioral Approach*, the co-authors pull together a vast field of research and advocate a model to unite the biomedical and psychological approaches to pain medicine, which all too frequently are used separately. The model is intended primarily for the numerous musculoskeletal pain syndromes that make up the majority of chronic pain, but the authors consider the approach, with minor modifications, to be useful for any chronic pain.

The book is arranged in three sections and includes a CD replete with 65 appendices that comprise many useful guides and tools for both patients and providers. Part I of the book provides an excellent and comprehensive review of the basic and historical concepts of pain and the neural and psychological mechanisms. At the end of this section, the authors present their biobehavioural model which is the focus for the remainder of the book. There is much evidence presented to support their view, but there is also an acknowledgement of the significant gaps in research regarding the way in which learning and psychological processes influence the development and maintenance of chronic pain syndromes. The information is presented in a readable style with sufficient background to allow practitioners who may be less familiar with psychology and learning in chronic pain to digest and integrate the ideas into their own concepts and practice.

The focus of Part II is the multi-axial assessment of people with chronic pain. To emphasize the importance of a broad context for assessment, the authors are quick to point

out the distinction between an assessment of pain and an assessment of a person with chronic pain. The structure of Part II is similar to the first section. There is an introductory chapter covering the objectives, tools, and limitations of a multi-axial assessment and subsequent chapters dedicated to physical assessment, psychophysiological assessment, pain characteristics and behaviours, and psychosocial assessment. These are well-written summaries of the vast literature on pain assessment. They are not exhaustive but condensed to a discussion of methods and procedures with acceptable psychometric properties in common use. Limitations and weaknesses of approaches are also discussed. Anger and post-traumatic stress disorder are given more dedicated attention as the authors consider their importance in chronic pain to be underrepresented in the literature.

In the final chapter of this section, which is the heart of the book, the authors describe an integrative assessment process which brings together subjective (patient responses to interviews and questionnaires), behavioural (casual and standardized observation and pain diary), and physiological (surface electromyography and autonomic responses) information to identify patient subgroups and match them to treatment. They present research validating the work and provide examples of improved outcomes. The authors also place attention on the importance of predicting disability early during the acute to chronic pain transition period and suggestions are given. However, they acknowledge that much improvement is still needed in this area and in a cost-effective manner.

In Part III of the book, the authors deal with the treatment of chronic pain, and topics include general principles, relaxation and biofeedback, operant therapy, and cognitive-behavioural therapy. The literature on these treatments is too large to cover in a comprehensive fashion, but the authors were able to summarize the topics in an especially

Coping with Chronic Pain Richard W. Hanson, Kenneth E. Gerber, 1993-04-23 Researchers from diverse disciplines have identified chronic pain as a critical national problem Despite its preponderance however definitive diagnosis of benign chronic pain is usually elusive and direct medical intervention is often ineffective Stressing self management Drs Hanson and Gerber offer an alternative approach to biomedical management or simply learning to live with it by presenting a comprehensive description of an integrated treatment approach for chronic pain sufferers The biopsychosocial perspective on the assessment and treatment of chronic pain that is described in this volume is based on the day to day operation of an effective outpatient pain clinic that evaluates clients about 1 3 of whom are treated in an intensive 21 day patient program The book opens with an explication of a theoretical model and a detailed description of its clinical implementation The model s application with patients is described with emphasis on the need for a flexible theoretical approach and individualized treatment which may include psychotherapy as an integral part of the self management paradigm The biomedical and biopsychosocial models are discussed in detail with respect to how they presume pain mechanisms operate how each views the phenomenology of the pain experience and what are considered appropriate interventions It is demonstrated how rather than focusing on repairing mechanical breakdowns in the body machine the biopsychosocial model concentrates on the individual with chronic pain How a person appraises reacts to and copes with the problem and its treatment are considered crucial issues The sociocultural context of the patient is also

taken into account The evaluation and preparation of patients for self management training is explicated Topics include the reciprocal interactions among physical sensations cognitive factors emotional responses overt behavior and socioenvironmental features The neurophysiological underpinnings of this model are briefly discussed common self management goals are summarized and essential targets for change such as dysfunctional action tendencies perceptions of uncontrollability and self focused attention are delineated Complete chapters cover the critical issues of physical activity reconditioning attentional refocusing and a non narcotic preventive approach for acute pain episodes Another chapter addresses administrative budgetary and staff issues for operating a comprehensive pain center Providing a flexible and comprehensive approach that is particularly effective for chronic pain sufferers but is also applicable to all types of illness this volume will be of value to psychologists physicians nurses social workers and physical therapists Ancillary health care professionals and administrators will also find much of interest

Determining the Biobehavioral Pain Patterns for Chronic Spine Pain Assessment Deborah Matteliano, 2010 Chronic Spine Pain CSP is the most common pain management problem Treatment guidelines recommend a biopsychosocial approach targeting pain responses Biobehavioral assessment is a strategy using a biopsychosocial approach that could streamline assessment The purpose of this study was to describe biobehavioral pain patterns BPP of a CSP population determine potential areas for biobehavioral interventions and determine outcomes predicted by biobehavioral patterns There were 4 aims 1 To describe

biobehavioral pain constructs for CSP 2 To determine the relationship of demographic and clinical characteristics to the biobehavioral pain constructs 3 To determine the extent to which chronic pain self efficacy coping self efficacy functional self efficacy and chronic pain coping strategies predicted biobehavioral pain constructs as potential areas for intervention 4 To determine the extent to which biobehavioral pain constructs predicted chronic pain pain right now pain disability physical and mental quality of life and depressed mood The Biopsychosocial Model for CSP Social Learning and Stress and Coping Theories supported biobehavioral assessment for CSP The design was a descriptive correlational survey The setting was an urban outpatient clinic providing treatment for musculoskeletal pain Patients were invited on one occasion Recruitment continued until a sample size of 100 was reached based upon power analysis Measurement included the Biobehavioral Pain Profile Instrument Chronic Pain Coping Inventory Chronic Pain Self efficacy Scales VAS for pain scales Pain Disability Index MOS Short Form 36 and the Centers for Epidemiologic Studies Depression Survey Data analysis included descriptive statistics to summarize biobehavioral constructs and scores on all study variables Chi Square analysis was used to examine relationships of gender age ethnicity education levels spine pain site medications taken for pain disability status and pain with elevated BPP constructs Multiple Regression was used to analyze relationships of elevated biobehavioral pain constructs with psychological and biopsychosocial pain factors Results indicated that the BPP constructs physiologic responsivity thoughts of disease progression past and current experiences and loss of control are relevant clinical indicators for assessment Self efficacy to manage pain and coping strategies are important pain responses for assessment and treatment Discouraging guarding behavior and excessive seeking of social support and improving confidence to cope with pain and relaxation strategies are potential areas for clinical intervention Assessing biobehavioral patterns are considerations for prescribing pain medications as one dimensional pain scales do not adequately address the clinically relevant areas Assessing depression quality of life and disability are important to improve outcomes More research is needed to understand important CSP factors for persons with less education and for diverse ethnic groups These results are preliminary requiring replication in other CSP populations
