

Genetik

Genetik

Gen. Mendel's Experiment (1865) Mendel's Law of Inheritance

Genetic inheritance is the process by which traits are passed from parents to offspring. Mendel's experiments with pea plants established the basic principles of genetics.

1. Mendel's experiments with pea plants established the basic principles of genetics.
2. He discovered that traits are inherited as discrete units (genes).
3. He found that each trait has two alleles, one from each parent.
4. The alleles can be dominant or recessive.
5. The dominant allele masks the effect of the recessive allele.
6. The recessive allele is only expressed when two copies are present.

Mendel's Law of Segregation

1. Each individual has two alleles for each trait.
2. During gamete formation, the alleles separate (segregate).
3. Each gamete receives only one allele.
4. The alleles recombine during fertilization.
5. The resulting offspring has two alleles for each trait.
6. The alleles can be dominant or recessive.
7. The dominant allele masks the effect of the recessive allele.
8. The recessive allele is only expressed when two copies are present.

Genetic Crosses

Genetic crosses are used to predict the outcome of inheritance. They involve crossing two individuals with known genotypes.

1. Monohybrid cross: Crossing two individuals for one trait.
2. Dihybrid cross: Crossing two individuals for two traits.
3. Test cross: Crossing an individual with a dominant phenotype with a recessive individual to determine its genotype.
4. Back cross: Crossing an individual with a dominant phenotype with a recessive individual to determine its genotype.
5. Reciprocal cross: Crossing two individuals in opposite directions to determine if a trait is sex-linked.
