Prediction-Based Caching of Popular Videos in Cluster-Centric Small Cell Networks [1],2017 *Edge Caching in a Small Cell Network* || *International Journal of Computing and Network Technology* .- 2014, Vol. 2, No. 1 Debashish Purkayastha,2014 **Semantic and Distributed Caching for MANET Environments** Khaleel Wafiq Mershad,2007

Mobile Ad Hoc Networks MANETs are receiving great attention among other wireless networks because of their easy deployment and important field of use Mobile nodes in MANETs acquire data from data servers through access points An access point is a fixed mobile node that has direct access all the time to a data server Each mobile node in a MANET sends a request to the access point each time it needs data In order to avoid this costly operation data caching at mobile nodes was employed Several caching techniques for MANETs have been proposed and implemented Cooperative and Adaptive Caching is a recent caching scheme that has been proposed for MANETs It is based on separating a query from its response and caching each one on a specific node in the network When a new request is issued nodes cooperate together to find the cached query and send its response to the requesting node In this thesis we adopt the basic concepts of Cooperative and Adaptive Caching in addition to analyzing each request semantically and comparing it with all cached queries The semantic analysis process may include trimming the request into fragments and combining the answers of these fragments to calculate the total answer of the request We make mathematical analysis and derive equations that govern the behavior of important system parameters We also perform simulations to study the performance of the proposed system especially its response time and hit ratio Distributed Caching in the Future Generation Networks Yining Hua,2020 **Integrated Networking, Caching, and Computing** F. RICHARD. YU,Tao Huang,Yunjie Liu,2020-06-30 Communications and Networking The integration of networking caching and computing into one system becomes a natural trend By incorporating caching functionality into the network the system can provide native support for highly scalable and efficient content retrieval and meanwhile duplicate content transmissions within the network can be reduced significantly As a consequence mobility flexibility and security of the network can be considerably improved On the other hand the incorporation of computing functionality endows the network with powerful capabilities of data processing hence enabling the execution of computationally intensive applications within the network By offloading mobile devices computation tasks to resource rich computing infrastructures in the vicinity or in remote clouds the task execution time can be considerably reduced and the local resources of mobile devices especially battery life can be conserved thus enriching the computing experience of mobile users Moreover networking caching and computing functionalities can complement and reinforce each other by interactions For instance some of the computation results can be cached for future use thus alleviating the backhaul workload On the other hand some cached content can be transcoded into other versions to better suit specific user demands thus economizing storage spaces and maximizing the utilization of caching Despite the potential vision of integrated networking caching and

computing systems a number of significant research challenges remain to be addressed before widespread application of the integrated systems Integrated Networking Caching and Computing address these challenges including the latency requirement bandwidth constraints interfaces mobility management resource and architecture tradeoffs convergence as well as non technical issues such as governance regulations etc Particularly it covers the resource allocation issue in which the management and allocation of three types of resources should be jointly considered to effectively and efficiently serve user requirements is especially challenging In addition it investigates non trivial security challenges are induced by a large number of intelligent devices nodes with self adaptation context awareness capabilities in integrated systems Book jacket

Edge Caching for Mobile Networks Wei Chen,H. Content Caching, Retrieval and Dissemination in Networks with Storage Lijun Dong,2011 The overwhelming use of today s network is for an endpoint to acquire a named content file As a result efficient content discovery and dissemination are becoming one of the key challenges for the design of future Internet protocols With significant advances in the technology areas of data storage storage capacities have increased dramatically while the price has been dropping very fast Thus it is valid to assume that each router on the Internet can cache content files that pass by and reply to content requests with its local copies In this thesis We firstly introduce the In Network Caching framework The content dissemination consists of two phases The first phase is content discovery which is the service provided by Content Name Resolution Through CNRS a requester discovers the location s of the desired content files We present the hybrid CNRS architecture in which CNRS servers form a hierarchy with national regional institutional CNRS servers from top to bottom On each level each CNRS server is responsible of monitoring the caching locations of a predesignated group of content files While there is a miss at the lower level the CNRS request will be forwarded to the higher level server which is similar to the hierarchical web caching Following the content discovery process the second phase is content retrieval in which the endpoint sends a request towards the hosting server and the requested content file will be returned to the requester as the outcome Cache n Capture is the baseline caching scheme in which each enroute router independently decides whether or not to cache passing content files When a request is routed through the router later the router can capture the request and reply back with the cached copy of the content instead of forwarding the request to the original hosting sites We advocate two enhancement techniques one is content broadcast which lets each router advertise its cached content files to the immediate neighbors so that a router can direct subsequent content requests to

nearby caching nodes and the other is coordinated caching which lets neighboring routers implicitly coordinate their caching decisions so that the collective cache utilization can be improved Through detailed simulations we show that these two caching techniques can significantly outperform other approaches This performance gain can be achieved with a small communication overhead by limiting content broadcast and coordination only within one hop Also we demonstrate that the storage requirement of the discussed schemes is reasonable Next we develop a mathematical model for CC to optimize the average content retrieval latency with limited storage on each router We propose Sequential Reassignment SR algorithm to solve the optimization problem In order to implement the proposed scheme in a distributed fashion we use exponential smoothing based estimator We compare the average content retrieval latencies and the average saved hops per enroute hit of the proposed distributed caching schemes with two other common cache replacement policies We study the impact of cache size and the locality parameter as well as the plateau factor for workload generation We show that our proposed scheme can always provide significant performance improvement under various settings Next we reconsider the optimization problem with content broadcast enhanced on each router We formulate a different mathematical model to obtain the maximum benefit of CB We propose the distributed Pseudo Gradient algorithm We compare the performance of the proposed caching scheme with the two replacement policies under the same simulation settings as in CC The results show that Distributed PG achieves performance improvement while keeping the communication overhead of content broadcast much smaller than traditional replacement policies In the final part of this work we investigate a gateway centric method for efficient content caching and routing In this method a content copy can get cached within an autonomous system AS while it is routed towards the destination and thus subsequent requests can be satisfied faster The caching location within an AS is determined by the gateway node through a hashing function We discuss the two alternatives of this method one with uniform caching level for every content file and the other with varying caching levels Through simulation studies we show that the gateway controlled caching method can greatly improve content retrieval latencies over traditional solutions such as three levels of caches placed by Hierarchical Caching and mirror servers deployed by Content Distribution Networks CDNs This gateway controlled caching method also outperforms a baseline caching method CC Additionally we study and compare the detailed performances of the two alternatives of this method Finally we develop a mathematical model whose objective is to guide the gateway to make optimal caching decisions within an AS and to achieve the minimum average content retrieval latency We provide a greedy caching algorithm to solve the optimization problem and show its superiority over random caching

Study of Steady-states in Distributed Data Caching in Ad Hoc Networks Julinda Lyn Taylor, 2012 There has been extensive research on cooperative distributed data caching in ad hoc networks However most of the work has focused on how to reduce the average delay of requests and improve the packet delivery ratio etc not much work has been done to study the steady state status achieved by distributed caching algorithms Information related to steady state status includes the

convergence time of the caching algorithms the final data cache placement in the network the stabilized cost performance and the performance comparison of distributed caching algorithms with an optimal centralized caching solution Previous theoretical results show that to minimize the average access cost in the network the optimal number of replicas of each data object is proportional to the square root or two thirds of the data s access frequency In this work we empirically show that the optimal replica number not only depends on the access frequencies of data but also depends on the storage capacity of each node We propose a heuristic model studying both cooperative hybrid and selfish caching steady states in ad hoc networks We formulate and solve the data caching problem optimally using integer linear programming ILP in order to validate our findings with regard to access frequency We also provide empirical data regarding the steady state cost of data based on the storage capacity of the nodes in the network Via extensive ns 2 simulations [10] we gain some insight regarding the steady states of distributed data caching
