The complete design guide

Press brake forming

Press brake forming is the process where metal is bent or folded when a die and a punch are used to bend the sheet of metal.

This is most often used to form parts from ferrous alloy and green for both prototype and production runs.

The maximum sheet thickness is ideally less than 8 times the

Bending

Bending is a process where metal which is in a flat shape is bent into the shape required for the design.

Bending is performed on a press.

Parts to be bent are placed on the die.

Forming near holes

When a part is made too close to a hole, the hole may become deformed. To save the cost of punching or drilling in a secondary operation, the following formula can be used to calculate the minimum distance required.

As a rule of thumb, the distance from the outside of the material to the bottom of the punch should be equal to the minimum flange length as prescribed by the air bend force chart.

For a hole $\leq 1"$ diameter the minimum distance $D = 2T + R$

For a slot or hole $> 1"$ diameter the minimum distance $D = 1.5T + R$

When using a punch press, or laser cutting, holes should never be less than that of the material thickness.

The minimum distance to material thickness for bend radius

Feature Type	Minimum distance guideline
Between hole and a bend	at least the hole length + bend radius
Between slot and a bend	at least the longest distance + bend radius
Between hole to slot and edge	at least the material thickness
Between elongated slot and edge	at least the material thickness
Between a rounded hole and an edge	at least the material thickness
Between a rounded hole and a bend	at least the material thickness + bend radius
Between corner rounded hole and a bend	at least the material thickness + bend radius
Between corner rounded hole	at least the material thickness
