State of the Art Analytical Methods for the Characterization of Biological Products and Assessment of Comparability Anthony R. Mire-Sluis,2005 With the latest advances in analytical technologies most biological products can now be extensively characterized in terms of their identity heterogeneity and impurity profile The currently available analytical methods both physicochemical and biological can characterize the primary secondary and to some extent the higher order structure of proteins The sensitivity and selectivity of these methods allow for the identification and characterization not only of the desired protein component but also many product related substances and impurities as well as process related impurities present in the drug preparations Using an appropriate selection of analytical tools it may be possible to demonstrate physicochemical and functional comparability between protein products manufactured before and after a manufacturing change or during product development However the extent of demonstrable comparability depends on the tests used on the nature of the product and on the basic understanding of structure function relationships Assessment of immunogenicity is also a critical component of product characterization and is highly dependent on the types of assays used

Shirazi, Attila Felinger, 2006-03-21 The second edition of Fundamentals of Preparative and Nonlinear Chromatography is devoted to the fundamentals of a new process of purification or extraction of chemicals or proteins widely used in the pharmaceutical industry and in preparative chromatography This process permits the preparation of extremely pure compounds satisfying the requests of the US Food and Drug Administration The book describes the fundamentals of thermodynamics mass transfer kinetics and flow through porous media that are relevant to chromatography It presents the models used in chromatography and their solutions discusses the applications made describes the different processes used their numerous applications and the methods of optimization of the experimental conditions of this process *Optimization Studies in Preparative Chromatography of Biomolecules* Sundar Ramanan, 2000 Optimization of preparative nonlinear chromatography was carried out for the first time for a biomolecule mixture Conventional wisdom on optimization which roots from analytical chromatography dictates optimizing resolution in an analytical column and obtaining similar separation in a large column for isolation Such a method of optimization significantly under uses the capacity of the column and consumes large quantities of mobile phase Hence in preparative chromatography the objective function is productivity a measure of compromise between the amount of feed that can be loaded on to the column and time Here we report results from optimization studies carried out on a closely related binary peptide mixture on an analytical reversed phase column The goal is to optimize productivity under various chromatographic modes nonlinear isocratic elution gradient elution stepwise elution and displacement chromatography In each mode feed

mixtures at highest possible concentration limited by solubility for increasing feed volumes was used. Productivity was monitored for increasing feed volumes and loading was stopped as it went through a maximum. However, in some cases, solubility limitations from one of the feed components prevented further increase in loading. Even with this constraint, high productivities (5–10 g product/L stationary phase/h) were achieved. Separate experiments were carried out to measure the adsorption isotherms of these peptides over the range permitted by solubility. Separations under nonlinear chromatographic conditions were applied to isolate commercially significant two microcystins, microcystin LR and microcystin LA, from a cyanobacterial process waste. Milligram level loading of microcystins was obtained on a solid phase extraction cartridge packed with 0.5 g of C1 stationary phase. The separations were first carried out on an analytical column and then scaled up to a preparative column. We also report a simple and economical process to purify phycocyanins and allophycocyanins from a cyanobacterial process waste stream for two kinds of applications: food colorant and biomedical marker. A detailed design for the large scale production of biliproteins for both applications is also presented. Economic evaluation of the process resulted in comparable costs with the current market price for food grade product and substantially lower cost for the biomedical grade product.

Advances in Chromatography Nelu Grinberg, Eli Grushka, 2017-08-15 For more than five decades scientists and researchers have relied on the *Advances in Chromatography* series for the most up to date information on a wide range of developments in chromatographic methods and applications. For Volume 54 the series editors have invited established well known chemists to offer cutting edge reviews of chromatographic methods applied in the life sciences that emphasize the underlying principle of separation science. The clear presentation of topics and vivid illustrations for which this series has become known makes the material accessible and engaging to analytical, biochemical, organic, polymer and pharmaceutical chemists at all levels of technical skill.

Mathematical Modeling and Scale-Up of Liquid Chromatography Tingyue Gu, 2015-04-14 Tingyue Gu's second edition provides a comprehensive set of nonlinear multicomponent liquid chromatography (LC) models for various forms of LC such as adsorption, size exclusion, ion exchange, reversed phase, affinity, isocratic gradient elution and axial radial flow LC. Much has advanced since the first edition of this book and the author's software described here is now used for teaching and research in 32 different countries. This book comes together with a complete software package with graphical user interface for personal computers offered free for academic applications. Additionally, this book provides detailed methods for parameter estimation of mass transfer coefficients, bed voidage, particle porosity and isotherms. The author gives examples of how to use the software for predictions and scale up. In contrast to the first edition, authors do not need to deal with complicated math. Instead, they focus on how to obtain a few parameters for simulation and how to compare simulation results with experimental data. After reading the detailed descriptions in the book, a reader is able to use the simulation software to investigate chromatographic behavior without doing actual experiments. This book is aimed at readers who are interested in learning about LC behaviors and at those who want to scale up LC for

preparative and large scale applications Both academic personnel and industrial practitioners can benefit from the use of the book This new edition includes New models and software for pellicular cored beads in liquid chromatography Introduction of user friendly software with graphical user interface Detailed descriptions on how to use the software Step by step instructions on parameter estimation for the models New mass transfer correlations for parameter estimation Experimental methods for parameter estimation Several actual examples using the model for product development and scale up Updated literature review
