Single-chip Bluetooth

Solutions Sudeepto Chakraborty, 2001 **Charge Transport in Low Dimensional Semiconductor Structures** Vito Dario Camiola, Giovanni Mascali, Vittorio Romano, 2020-03-02 This book offers from both a theoretical and a computational perspective an analysis of macroscopic mathematical models for description of charge transport in electronic devices in

particular in the presence of confining effects such as in the double gate MOSFET. The models are derived from the semiclassical Boltzmann equation by means of the moment method and are closed by resorting to the maximum entropy principle. In the case of confinement, electrons are treated as waves in the confining direction by solving a one-dimensional Schrödinger equation, obtaining subbands, while the longitudinal transport of subband electrons is described semiclassically. Limiting energy transport and drift-diffusion models are also obtained by using suitable scaling procedures. An entire chapter in the book is dedicated to a promising new material like graphene. The models appear to be sound and sufficiently accurate for systematic use in computer-aided design simulators for complex electron devices. The book is addressed to applied mathematicians, physicists, and electronic engineers. It is written for graduate or PhD readers, but the opening chapter contains a modicum of semiconductor physics, making it self-consistent and useful also for undergraduate students.

Semiconductor fundamentals Robert F. Pierret, 1983 *Scaled Planar Floating-gate NAND Flash Memory*

Technology Shyam Sunder Raghunathan, 2010. NAND flash memories are ubiquitous in their use as portable storage media in cellphones, cameras, music players, and other portable electronic devices. The NAND flash memory device, consisting of a floating-gate transistor cell, is the most aggressively scaled electronic device as evidenced by ever-increasing memory capacities. In this work, we will examine possible problems arising from continued scaling of these structures and discuss novel solutions to overcome them. Firstly, we investigate scaling of the conventional poly-silicon floating-gate aimed at reducing cell-to-cell interference. We experimentally delineate a new reliability concern for the first time with programming current through ultra-thin poly-silicon floating-gates becoming increasingly ballistic. We also experimentally demonstrate doping-related issues in the poly-silicon floating-gate. We then apply a novel metal-based floating-gate cell for the first time designed to overcome the problems discussed above. We explore factors that influence the choice of metal and demonstrate excellent functionality in ultra-thin metal floating-gate cells scaled down to 3 nm TiN floating-gate thickness, thus greatly reducing cell-to-cell interference. Finally, in order to facilitate continued scaling of the control dielectric, we explore replacement of the conventional silicon oxide nitride dielectric with high- k dielectric materials. We integrate poly-silicon and metal floating-gate cells with Al₂O₃ high- k control dielectric. Further, we establish that a deeper work-function control gate is helpful in reducing gate injection. Combining ultra-thin metal floating-gate, high- k control dielectric, and deep work-function control gate, we enable the planar floating-gate cell as a scalable candidate.

Silicon-Plasmonic Photodetectors for High-Speed Signal Processing Mühlbrandt, Sascha Johannes, 2025-04-01. This book introduces and experimentally demonstrates a novel approach to exploit internal photoemission (IPE) for photodetection in silicon. The resulting device represents the first IPE-based detector that operates at technically viable performance figures. It combines a compact footprint and a high bandwidth with monolithic cointegration in silicon photonic circuits. The new concept opens an attractive route for optoelectronic generation and detection of waveforms in the sub-THz and THz range.
