Abstract

Simulation modeling has become a promising technology for a variety of operations management applications. The modern software has made it easy for managers to initiate simulation projects to address various operational problems. The objective of this presentation is to review the latest applications of simulation projects addressing operations management issues.

Introduction

Computer-assisted simulation modeling has become more common as a method of inquiry for operations management and the service industry since the 1990's. Many technology driven managers now rely on extensive use of simulation to test new ideas and options before actual implementation of their ideas. Instead of building extensive mathematical models by experts, the readily available simulation software has made it possible to model and analyze the operation of a real system by managers who are not well versed in programming languages. Simulation allows the manager to both quantify and observe the system's behavior. Whether the system is a production line, a distribution network or a communications system, simulation can be used to study and compare alternative designs or troubleshoot existing operations. With simulation models, the manager can explicitly visualize how an existing operation might perform under varied inputs, and how a new or proposed operation might behave under same or different inputs [2,13]. The ability to easily construct and execute models and to generate statistics and animations about results has been the main attractions of simulation. The windows based simulation software such as ARENA, have made simulation modeling not only affordable but relatively easy for managers to initiate simulation studies of a variety of situations including operations and processes, feasibility studies, business processes, human resource deployment, call center staffing, capacity planning and others.

Simulation Modeling In Operations Management:

Computer Simulation in Operations Management Keith Klafehn, Jay Weinroth, Jess S. Boronico, 1996-10-21 The management of production and service processes can be supported by microcomputer simulation models effectively and inexpensively if the techniques are presented in an understandable manner Drs Klafehn Weinroth and Boronico prove this and show how to do it not only for the benefit of operations managers themselves but for others with management responsibilities in a variety of businesses and industries They will learn how important daily operations problems can be modeled on a microcomputer gain understanding of overall simulation methodology and learn the several forms of cost savings achievable through simulation For teachers in business schools the book will also provide a link between general management and the management of engineering and R D The first chapter introduces the reader to the concepts and steps for undertaking a microcomputer simulation project In addition the benefits drawbacks and myths are reviewed in detail Chapter two explores in a conversational scenario what is involved in taking a management operations problem involving a truck transfer depot from its point of inception to the formulation of a systems operation model which in a later chapter is ultimately put into a computer simulation model and tested to in a sense come up with answers to the questions posed in the hypothetical conversation Subsequent chapters in the book are oriented to a discussion of other operations management problems and the effort to seek insight and solutions through simulation modeling A Just in Time manufacturing system is addressed recognizing the push pull concept as well as looking at the quality aspect Attempting to determine the optimum levels for safety stock order points and order quantity is investigated through computer simulation These levels are predicated on balancing the costs associated with ordering and holding goods as well as the penalty costs of stocking out Using a simulated environment enables the inclusion of the variability evidenced by the type of distribution The remaining chapters also review alternative rules and what ifs as applied to machine configuration facility location for a satellite EMS unit and job shop operations Each of the applications chapters provides a printout of the basic computer model written in GPSS that was then modified to investigate alternative scenarios
