Mathematical Modeling and Simulation of Intravascular Drug Delivery from Drug-eluting Stents with Biodegradable PLGA Coating, 2014 Drug eluting stents DES are commonly used in coronary angioplasty procedures A DES elutes drug compounds from a thin polymeric coating into the surrounding coronary artery tissue to reduce in stent restenosis a significant lumen loss due to growth of vascular tissue Biodurable non erodible polymers are often used in the current DES coatings which stay permanently in the patients While promising treatment results were obtained in stent restenosis remains an issue and late in stent thrombosis which is associated with hypersensitivities to the polymer coatings is also reported Increasing interests have been raised towards the design of a more biocompatible coating in particular a poly lactic acid co glycolic acid PLGA coating for DES applications to improve the drug delivery and reduce adverse outcomes in patients This dissertation aims to develop a mathematical model for describing the process of drug release from a biodegradable PLGA stent coating and subsequent drug transport pharmacokinetics and distribution in the arterial wall A model framework is developed in the first part of the dissertation where a biodurable stent coating is considered and the intravascular delivery of a hydrophobic drug from an implanted DES in a coronary artery is mathematically modeled The model integrates drug diffusion in the coating with drug diffusion and reversible drug binding in the arterial wall The model was solved by the finite volume method The drug diffusivities in the coating and in the arterial wall were investigated for the impact on the drug release and arterial drug uptake In particular anisotropic vascular drug diffusivities result in slightly different average arterial drug levels but can lead to very different spatial drug distributions and is likely related to the reported non uniform restenosis thickness distribution in the artery cross section The second part of the dissertation focuses on modeling drug transport in a biodegradable poly D L lactic co glycolic acid PLGA coating A mathematical model for the PLGA degradation erosion and coupled drug release from PLGA stent coating is developed and validated An analytical expression is derived for PLGA mass loss The drug transport model incorporates simultaneous drug diffusion through both the polymer solid and the liquid filled pores in the coating where an effective drug diffusivity model is derived taking into account factors including polymer molecular weight change stent coating porosity change and drug partitioning between solid and aqueous phases The model predicted in vitro sirolimus release from PLGA stent coating and demonstrated the

significance of the developed model by comparing with existing drug transport models An integrated model for intravascular drug delivery from a PLGA coated DES is developed in the last part of the dissertation The integrated model describes the processes of drug release in a PLGA coating and subsequent drug delivery distribution and drug pharmacokinetics in the arterial wall Model simulations first compared a biodegradable PLGA coating with a biodurable coating for stent based drug delivery The simulations further investigated drug internalization interstitial fluid flow in the arterial wall and stent embedment for impact on the drug release and arterial drug distribution of a PLGA coated stent These three factors greatly change the average drug concentrations in the arterial wall Each factor leads to significant and distinguished alterations in the arterial drug distribution that can potentially influence the treatment outcomes The developed model here provides the basis of a design tool for evaluating and studying a PLGA coating for stent applications Simulations using the model helped to provide insights into the potential impacts of various factors that can affect the efficacy of drug delivery With the developed model optimization of the model parameters can also be performed for future exploration on the design of PLGA coated drug eluting stents

Mathematical Models of Tumor-Immune System Dynamics Amina Eladdadi, Peter Kim, Dann Mallet, 2014-11-06 This collection of papers offers a broad synopsis of state of the art mathematical methods used in modeling the interaction between tumors and the immune system These papers were presented at the four day workshop on Mathematical Models of Tumor Immune System Dynamics held in Sydney Australia from January 7th to January 10th 2013 The workshop brought together applied mathematicians biologists and clinicians actively working in the field of cancer immunology to share their current research and to increase awareness of the innovative mathematical tools that are applicable to the growing field of cancer immunology Recent progress in cancer immunology and advances in immunotherapy suggest that the immune system plays a fundamental role in host defense against tumors and could be utilized to prevent or cure cancer Although theoretical and experimental studies of tumor immune system dynamics have a long history there are still many unanswered questions about the mechanisms that govern the interaction between the immune system and a growing tumor The multidimensional nature of these complex interactions requires a cross disciplinary approach to capture more realistic dynamics of the essential biology The papers presented in this volume explore these issues and the results will be of interest to graduate students and researchers in a variety of fields within mathematical and biological sciences

and Simulation of Controlled Drug Release from Coated Pellets ,2007 **Assessing Bioavailability of Drug Delivery Systems** Jean-Maurice Vergnaud,Iosif-Daniel Rosca,2005-05-26 Exploring how to apply in vitro in vivo correlations for controlled release dosage forms Bioavailability of Drug Delivery Systems Mathematical Modeling clearly elucidates this complex phenomena and provides a guide for the respective mathematical modeling The book introduces mathematical modeling methods for calculating the profiles of plasma levels obtained with controlled release dosage forms and provides examples and case studies to illustrate the techniques employed The author has considerable experience in investigating mathematical fundamentals that are related to pharmaco and toxicokinetics modified release drug products physiologic pharmacokinetics and statistical treatment in clinical situations The mathematical models he has developed are particularly powerful because they account for such major parameters as the kinetics of drug release controlled by diffusion or by erosion and the kinetics of absorption into and elimination out of the plasma They are also able to solve the problem of determining the drug level in plasma as a result of patient non compliance incorrect dosage and incorrect frequency and to determine the best dosage forms necessary for therapy Using master curves the book highlights the inter variability of the patients often expressed by different responses towards a drug Thus after evaluating a patient s pharmacokinetic parameters the dose can be adapted to the patient with the expectation of decreasing the side effects for each patient Using dimensionless numbers in repeated doses either for the time or for the plasma drug concentration makes the master curves useful for every drug providing that its pharmacokinetics was linear These master curves address clear information either to the patients or to the therapists in a didactic and easy way The patients can see from first look the effects of non compliance and therapists can see the dramatic effects of inter variability of patients towards a drug Drug discovery and dosage forms have become an increasingly time consuming and expensive process The development of a single drug can leave behind more than 10 to 15 years of work Discussing time and cost effective methods as alternatives to conventional in vivo methods the book helps you analyze and integrate in vitro in vivo correlations and apply them to patient care and drug consultation situations *A PHYSIOLOGICAL FLOW MODEL FOR THE GASTROINTESTINAL ABSORPTION AND PLASMA KINETICS OF ASPIRIN.* Elizabeth M. Topp,1986 This result was qualitatively confirmed by experiments in rats Dosage forms which release aspirin in the jejunum rather than the stomach are therefore postulated to provide more effective antiplatelet activity *Controlled Drug Delivery* Kinam Park,1997 This volume discusses the challenges of creating controlled release dosage forms that will deliver new therapeutic agents based on high molecular weight molecules It examines strategies for delivering drugs through resistant biological barriers and surveys a variety of topics including drug targeting self regulated drug delivery protein drug delivery biosensors cell and tissue engineering new biomaterials modeling methods pharmacokinetics and U S federal regulations *Mathematical Reviews* ,2006 *Dissertation Abstracts International* ,2009 **Proceedings in Print** ,1990 Shargel and Yu's Applied Biopharmaceutics & Pharmacokinetics, 8th Edition Murray P.
