Mathematics Form And Function By Saunders MacLane:

Mathematics Form and Function Saunders MacLane, 2012-12-06 This book records my efforts over the past four years to capture in words a description of the form and function of Mathematics as a background for the Philosophy of Mathematics My efforts have been encouraged by lectures that I have given at Heidelberg under the auspices of the Alexander von Humboldt Stiftung at the University of Chicago and at the University of Minnesota the latter under the auspices of the Institute for Mathematics and Its Applications Jean Benabou has carefully read the entire manuscript and has offered incisive comments George Glauberman Carlos Kenig Christopher Mulvey R Narasimhan and Dieter Puppe have provided similar comments on chosen chapters Fred Linton has pointed out places requiring a more exact choice of wording Many conversations with George Mackey have given me important insights on the nature of Mathematics I have had similar help from Alfred Aeppli John Gray Jay Goldman Peter Johnstone Bill Lawvere and Roger Lyndon Over the years I have profited from discussions of general issues with my colleagues Felix Browder and Melvin Rothenberg Ideas from Tammo Tom Dieck Albrecht Dold Richard Lashof and Ib Madsen have assisted in my study of geometry Jerry Bona and B L Foster have helped with my examination of mechanics My observations about logic have been subject to constructive scrutiny by Gert Müller Marian Boykan Pour El Ted Slaman R Voreadou Volker Weispfennig and Hugh Woodin *Review of Saunders MacLane's Mathematics: Form and Function* H. A. Pogorzelski, 2010 *Introduction to Representation Theory* Pavel I. Etingof, Oleg Golberg, Sebastian Hensel, Tiankai Liu, Alex Schwendner, Dmitry Vaintrob, Elena Yudovina, 2011 Very roughly speaking representation theory studies symmetry in linear spaces It is a beautiful mathematical subject which has many applications ranging from number theory and combinatorics to geometry probability theory quantum mechanics and quantum field theory The goal of this book is to give a holistic introduction to representation theory presenting it as a unified subject which studies representations of associative algebras and treating the representation theories of groups Lie algebras and quivers as special cases Using this approach the book covers a number of standard topics in the representation theories of these structures Theoretical material in the book is supplemented by many problems and exercises which touch upon a lot of additional topics the more difficult exercises are provided with hints The book is designed as a textbook for advanced undergraduate and beginning graduate students It should be accessible to students with a strong background in linear algebra and a basic knowledge of abstract algebra **Sets, Logic and Categories** Peter J. Cameron, 2012-12-06 Set theory logic and category theory lie at the foundations of mathematics and have a dramatic effect on the mathematics that we do through the Axiom of Choice Gödel's Theorem and the Skolem Paradox But they are also rich mathematical theories in their own right contributing techniques and results to working mathematicians such as the Compactness Theorem and module categories The book is aimed at those who know some mathematics and want to know more about its building blocks Set theory is first treated naively an axiomatic treatment is given after the basics of first order logic have been introduced The

discussion is supported by a wide range of exercises The final chapter touches on philosophical issues The book is supported by a World Wide Web site containing a variety of supplementary material Gödel, Tarski and the Lure of Natural Language Juliette Kennedy, 2020-12-17 Is mathematics entangled with its various formalisations Or are the central concepts of mathematics largely insensitive to formalisation or formalism free What is the semantic point of view and how is it implemented in foundational practice Does a given semantic framework always have an implicit syntax Inspired by what she calls the natural language moves of Gödel and Tarski Juliette Kennedy considers what roles the concepts of entanglement and formalism freeness play in a range of logical settings from computability and set theory to model theory and second order logic to logicity developing an entirely original philosophy of mathematics along the way The treatment is historically logically and set theoretically rich and topics such as naturalism and foundations receive their due but now with a new twist
