Constanda, Paul J. Harris, Bardo E. J. Bodmann, 2024-07-13 This contributed volume collects papers presented during a special session on integral methods in science and engineering at the 2023 International Conference on Computational and Mathematical Methods in Science and Engineering CMMSE held in Cadiz Spain from July 3-8 2023. Covering the applications of integral methods to scientific developments in a variety of fields, the chapters in this volume are written by well-known researchers in their respective disciplines and present new results in both pure and applied mathematics. Each chapter shares a common methodology based on a combination of analytic and computational tools, an approach that makes this collection a valuable multidisciplinary reference on how mathematics can be applied to various real-world processes and phenomena.

Approximation by Solutions of Partial Differential Equations

B. Fuglede, M. Goldstein, W. Haussmann, W.K. Hayman, L. Rogge, 2012-12-06 This volume consists of the proceedings of the NATO Advanced Research Workshop on Approximation by Solutions of Partial Differential Equations, Quadrature Formulae and Related Topics, which was held at Hanstholm, Denmark. These proceedings include the main invited talks and contributed papers given during the workshop. The aim of these lectures was to present a selection of results of the latest research in the field. In addition to covering topics in approximation by solutions of partial differential equations and quadrature formulae, this volume is also concerned with related areas such as Gaussian quadratures, the Pompeiu problem, rational approximation to the Fresnel integral, boundary correspondence of univalent harmonic mappings, the application of the Hilbert transform in two-dimensional aerodynamics, finely open sets in the limit set of a finitely generated Kleinian group, scattering theory, harmonic and maximal measures for rational functions, and the solution of the classical Dirichlet problem. In addition, this volume includes some problems in potential theory which were presented in the Problem Session at Hanstholm.

Lipman

Bers, a Life in Mathematics Linda Keen, Irwin Kra, Rubí E. Rodríguez, 2015-09-15 The book is part biography and part collection of mathematical essays that gives the reader a perspective on the evolution of an interesting mathematical life. It is all about Lipman Bers, a giant in the mathematical world who lived in turbulent and exciting times. It captures the essence of his mathematics: a development and transition from applied mathematics to complex analysis, quasiconformal mappings and moduli of Riemann surfaces, and the essence of his personality: a progression from a young revolutionary refugee to an elder statesman in the world of mathematics and a fighter for global human rights and the end of political torture. The book contains autobiographical material and short reprints of his work. The main content is in the exposition of his research contributions, sometimes with novel points of view by students, grand students and colleagues. The research described was fundamental to the growth of a central part of 20th century mathematics that now in the 21st century is in a healthy state with much current interest and activity. The addition of personal recollections, professional tributes and photographs yields a picture of a man, his personal and professional family and his time.

A History in Sum Steve Nadis, Shing-Tung Yau, 2013-11-01 In the twentieth century, mathematicians at Harvard University trailblazed a distinctly American tradition in algebraic geometry and topology, complex analysis, number theory and other esoteric fields. Written in accessible prose, *A History in Sum* takes a close look at the contributions to higher mathematics of these extraordinary minds.

The Analysis of Solutions of Elliptic Equations Nikolai Tarkhanov, 2013-03-09 This book is intended as a continuation of my book *Parametrix Method in the Theory of Differential Complexes* (see 291). There we considered complexes of differential operators between sections of vector bundles and we strived more than for details. Although there are many applications to for maximal generality overdetermined systems, such an approach left me with a certain feeling of dissatisfaction, especially since a large number of interesting consequences can be obtained without a great effort. The present book is conceived as an attempt to shed some light on these new applications. We consider as a rule differential operators having a simple structure on open subsets of $\mathbb{R}^n$. Currently this area is not being investigated very actively, possibly because it is already very highly developed. For example, the book of Palamodov (213) allows us to obtain new results in the qualitative theory of differential equations and frequently in definitive form. The greater part of the material presented is related to applications of the Leray series for a solution of a system of differential equations, which is a convenient way of writing the Green formula. The culminating application is an analog of the theorem of Vitushkin (303) for uniform and mean approximation by solutions of an elliptic system. Somewhat aside are several questions on ill-posedness, but the parametrix method enables us to obtain here a series of hitherto unknown facts.

Part 2 leads the reader up to the regularity theory for nonlinear elliptic boundary value problems illustrated by a particular and fascinating topic. There is no comparably comprehensive treatment of the problem of boundary regularity of minimal surfaces available in book form. This long awaited book is a timely and welcome addition to the mathematical literature. *Quasiconformal Mappings in the Plane and Complex Dynamics* Luis T. Magalhães, 2025-06-10

This book comprehensively explores the foundations of quasiconformal mappings in the complex plane especially in view of applications to complex dynamics. Besides playing a crucial role in dynamical systems these mappings have important applications in complex analysis geometry topology potential theory and partial differential equations functional analysis and calculus of variations electrostatics and nonlinear elasticity. The work covers standard material suitable for a one year graduate level course and extends to more advanced topics in an accessible way even for students in an initial phase of university studies who have learned the basics of complex analysis at the usual level of a rigorous first one semester course on the subject. At the frontier of complex analysis with real analysis quasiconformal mappings appeared in 1859-60 in the cartography work of A. Tissot well before the term quasiconformal was coined by L. Ahlfors in 1935. The detailed study of these mappings began in 1928 by H. Grötzsch and L. Ahlfors seminal work published in 1935 significantly contributed to their development and was considered for awarding him the Fields Medal in 1936. The theory further evolved in 1937 and 1939 with O. Teichmüller's contributions and subsequent advancements are partially covered in this book. Organized into ten chapters with eight appendices this work aims to provide an accessible self contained approach to the subject and includes examples at various levels and extensive applications to holomorphic dynamics. Throughout the text historical notes contextualize advancements over time. A sequel to the author's previous book *Complex Analysis and Dynamics in One Variable with Applications* also published by Springer this volume might be suitable for students in mathematics physics or engineering. A solid background in basic mathematical analysis is recommended to fully benefit from its content. **Recent Trends in Formal and Analytic Solutions of Diff. Equations**

Finite Möbius Groups, Minimal Immersions of Spheres, and Moduli Gabor Toth, 2012-12-06

Spherical soap bubbles isometric minimal immersions of round spheres into round spheres or spherical immersions for short belong to a fast growing and fascinating area between algebra and geometry This theory has rich interconnections with a variety of mathematical disciplines such as invariant theory convex geometry harmonic maps and orthogonal multiplications In this book the author traces the development of the study of spherical minimal immersions over the past 30 plus years including Takahashi s 1966 proof regarding the existence of isometric minimal immersions DoCarmo and Wallach s study of the uniqueness of the standard minimal immersion in the seventies and more recently he examines the variety of spherical minimal immersions which have been obtained by the equivariant construction as $SU(2)$ orbits first used by Mashimo in 1984 and then later by DeTurck and Ziller in 1992 In trying to make this monograph accessible not just to research mathematicians but mathematics graduate students as well the author included sizeable pieces of material from upper level undergraduate courses additional graduate level topics such as Felix Klein s classic treatise of the icosahedron and a valuable selection of exercises at the end of each chapter Bulletin of the American Mathematical Society ,2001

Value Distribution Theory and Related Topics Grigor A. Barsegian, Ilpo Laine, Chung-Chun Yang, 2006-05-02 The Nevanlinna theory of value distribution of meromorphic functions one of the milestones of complex analysis during the last century was created to extend the classical results concerning the distribution of entire functions to the more general setting of meromorphic functions Later on a similar reasoning has been applied to algebroid functions subharmonic functions and meromorphic functions on Riemann surfaces as well as to analytic functions of several complex variables holomorphic and meromorphic mappings and to the theory of minimal surfaces Moreover several applications of the theory have been exploited including complex differential and functional equations complex dynamics and Diophantine equations The main emphasis of this collection is to direct attention to a number of recently developed novel ideas and generalizations that relate to the development of value distribution theory and its applications In particular we mean a recent theory that replaces the conventional consideration of counting within a disc by an analysis of their geometric locations Another such example is presented by the generalizations of the second main theorem to higher dimensional cases by using the jet theory Moreover similar ideas apparently may be applied to several related areas as well such as to partial differential equations and to differential geometry Indeed most of these applications go back to the problem of analyzing zeros of certain complex or real functions meaning in fact to investigate level sets or level surfaces
