Collusion Via Algorithms Mohsin Rahim, 2022. The technological advancement at an unprecedented pace has resulted in legislation and regulation failing to keep up with new challenges faced by the consumers. The legislators and regulators are consequently struggling to amend provisions. In the traditional sense collusion is amongst humans or actions caused by humans. New technological advances have resulted in such collusions being taken by or in active connivance of algorithms. The major issues across jurisdictions are 1. What constitutes collusion in the digital age and 2. What is the method to collect such evidence that they can rely on to enforce Competition law without disclosing the proprietary commercially sensitive information and scuttling innovation. The aim and objective of this paper is to analyze the functioning of algorithms under the lens of competition law to draw a comparative analysis of the draft regulations from the jurisdictions of the European Union, the United Kingdom and the United States and provide suggestive regulatory reforms in India by analyzing the regulations being implemented with regard to algorithmic collusions in the abovementioned jurisdictions. The paper shall also attempt to put forward other measures which are not a part of any regulation yet that can be implemented to counter collusion by algorithms.

Artificial Intelligence & Collusion Ariel Ezrachi, Maurice E. Stucke, 2019 The development of self learning and independent computers has long captured our imagination The HAL 9000 computer in the 1968 film 2001 A Space Odyssey for example assured I am putting myself to the fullest possible use which is all I think that any conscious entity can ever hope to do Machine learning raises many challenging legal and ethical questions as to the relationship between man and machine humans control or lack of it over machines and accountability for machine activities While these issues have long captivated our interest few would envision the day when these developments and the legal and ethical challenges raised by them would become an antitrust issue Sophisticated computers are central to the competitiveness of present and future markets With the accelerating development of AI they are set to change the competitive landscape and the nature of competitive restraints As pricing mechanisms shift to computer pricing algorithms so too will the types of collusion We are shifting from the world where executives expressly collude in smoke filled hotel rooms to a world where pricing algorithms continually monitor and adjust to each other's prices and market data Our paper addresses these developments and considers the application of competition law to an advanced computerised trade environment After discussing the way in which computerised technology is changing the competitive landscape we explore four scenarios where AI can foster anticompetitive collusion and the legal and ethical challenges each scenario raises

Algorithms, Machine Learning, and Collusion Ulrich Schwalbe, 2018 This paper discusses the question whether self learning price setting algorithms are able to coordinate their pricing behaviour to achieve a collusive outcome that maximizes the joint profits of the firms using these algorithms While the legal literature generally assumes that algorithmic collusion is indeed possible and in fact very easy the computer science literature on cooperation between algorithms as well as the economics literature on collusion in experimental oligopolies indicate that a coordinated and in particular tacitly collusive behaviour is in general rather difficult to achieve Many studies have shown that some form of communication is of vital importance for collusion if there are more than two firms in a market Communication between algorithms is also a topic in artificial intelligence research and some recent contributions indicate that algorithms may learn to communicate albeit in a rather limited way This leads to the conclusion that algorithmic collusion is currently much more difficult to achieve than often assumed in the legal literature and is therefore currently not a particularly important

competitive concern In addition there are also several legal problems associated with algorithmic collusion for example questions of liability of auditing and monitoring algorithms as well as enforcement The limited resources of competition authorities should rather be devoted to more pressing problems as for example the abuse of dominant positions by large online platforms

We are Data John Cheney-Lippold, 2017 What identity means in an algorithmic age how it works how our lives are controlled by it and how we can resist it Algorithms are everywhere organizing the near limitless data that exists in our world Derived from our every search like click and purchase algorithms determine the news we get the ads we see the information accessible to us and even who our friends are These complex configurations not only form knowledge and social relationships in the digital and physical world but also determine who we are and who we can be both on and offline Algorithms create and recreate us using our data to assign and reassign our gender race sexuality and citizenship status They can recognize us as celebrities or mark us as terrorists In this era of ubiquitous surveillance contemporary data collection entails more than gathering information about us Entities like Google Facebook and the NSA also decide what that information means constructing our worlds and the identities we inhabit in the process We have little control over who we algorithmically are Our identities are made useful not for us but for someone else Through a series of entertaining and engaging examples John Cheney Lippold draws on the social constructions of identity to advance a new understanding of our algorithmic identities We Are Data will educate and inspire readers who want to wrest back some freedom in our increasingly surveilled and algorithmically constructed world Provided by publisher
