This book is designed to supplement standard texts and teaching material in the areas of differential equations in engineering such as in Electrical, Mechanical, and Biomedical engineering. Emphasis is placed on the Boundary Value Problems that are often met in these fields. This keeps the the spectrum of the book rather focussed. The book has basically emerged from the need in the authors' lectures on Advanced Numerical Methods in Biomedical Engineering at Yeditepe University and it is aimed to assist the students in solving general and application specific problems in Science and Engineering at upper undergraduate and graduate level. Majority of the problems given in this book are self contained and have varying levels of difficulty to encourage the student. Problems that deal with MATLAB simulations are particularly intended to guide the student to understand the nature and demystify theoretical aspects of these problems. Relevant references are included at the end of each chapter. Here one will also find large number of software that supplements this book in the form of MATLAB script m files. The name of the files used for the solution of a problem are indicated at the end of

each corresponding problem statement There are also some exercises left to students as homework assignments in the book An outstanding feature of the book is the large number and variety of the solved problems that are included in it Some of these problems can be found relatively simple while others are more challenging and used for research projects All solutions to the problems and script files included in the book have been tested using recent MATLAB software The features and the content of this book will be most useful to the students studying in Engineering fields at different levels of their education upper undergraduate graduate

Analytical Methods for Nonlinear Oscillators and Solitary Waves Chu-Hui He,Hamid M. Sedighi, Ji-Huan He,Yusry El-Dib,Dragan Marinkovic,2023-11-24 The most well known analytical method is the perturbation method which has led to the great discovery of Neptune in 1846 and since then mathematical prediction and empirical observation became two sides of a coin in physics However the perturbation method is based on the small parameter assumption and the obtained solutions are valid only for weakly nonlinear equations which have greatly limited their applications to modern physical problems To overcome the shortcomings many mathematicians and physicists have been extensively developing various technologies for several centuries however there is no universal method for all nonlinear problems and mathematical prediction with remarkably high accuracy is still much needed for modern physics for example the solitary waves traveling along an unsmooth boundary the low frequency property of a harvesting energy device the pull in voltage in a micro electromechanical system Now various effective analytical methods have appeared in the open literature e g the homotopy perturbation method and the variational iteration method An analytical solution provides a fast insight into its physical properties of a practical problem e g frequency amplitude relation of a nonlinear oscillator solitary wave in an optical fiber pull in instability of a microelectromechanical system making mathematical prediction even more attractive in modern physics Nonlinear physics has been developing into a new stage where the fractal fractional differential equations have to be adopted to describe more accurately discontinuous problems and it becomes ever more difficult to find an analytical solution for such nonlinear problems and the analytical methods for fractal fractional differential equations have laid the foundations for nonlinear physics
