Modeling and Identification of Linear Parameter-Varying Systems Roland Toth, 2010-06-13 Through the past 20 years the framework of Linear Parameter Varying LPV systems has become a promising system theoretical approach to handle the control of mildly nonlinear and especially position dependent systems which are common in mechatronic applications and in the process industry The birth of this system class was initiated by the need of engineers to achieve better performance for nonlinear and time varying dynamics common in many industrial applications than what the classical framework of Linear Time Invariant LTI control can provide However it was also a primary goal to preserve simplicity and reuse the powerful LTI results by extending them to the LPV case The progress continued according to this philosophy and LPV control has become a well established field with many promising applications Unfortunately modeling of LPV systems especially based on measured data which is called system identification has seen a limited development since the birth of the framework Currently this bottleneck of the LPV framework is halting the transfer of the LPV theory into industrial use Without good models that fulfill the expectations of the users and without the understanding how these models correspond to the dynamics of the application it is difficult to design high performance LPV control solutions This

book aims to bridge the gap between modeling and control by investigating the fundamental questions of LPV modeling and identification It explores the missing details of the LPV system theory that have hindered the formation of a well established identification framework *Index of Conference Proceedings Received* British Library. Control of Cyber-Physical Systems Danielle C. Tarraf,2013-06-30 Cyber physical systems CPS involve deeply integrated tightly coupled computational and physical components These systems spanning multiple scientific and technological domains are highly complex and pose several fundamental challenges They are also critically important to society's advancement and security The design and deployment of the adaptable reliable CPS of tomorrow requires the development of a basic science foundation synergistically drawing on various branches of engineering mathematics computer science and domain specific knowledge This book brings together 19 invited papers presented at the Workshop on Control of Cyber Physical Systems hosted by the Department of Electrical Computer Engineering at The Johns Hopkins University in March 2013 It highlights the central role of control theory and systems thinking in developing the theory of CPS in addressing the challenges of cyber trust and cyber security and in advancing emerging cyber physical applications ranging from smart grids to smart buildings cars and robotic systems *Bulletin of the Philosophical Society of Washington* Philosophical Society of Washington (Washington, D.C.),1892 Vols 1 14 16 include the society's Proceedings 1871 1905 1961
