

Example 11.6. A barrage is to be constructed on a river having a high flood discharge of about 8,100 cumecs, with the given data as follows :

Average bed level of the river	= 257.0 m
High Flood Level (before construction of barrage)	= 262.2 m
Permissible afflux	= 1.0 m
Pond Level	= 260.6 m.

Stage Discharge curve for the river at the barrage site is given in Fig. 11.19. Prepare a complete hydraulic design for the undersluice section as well as for other barrage bay section, on the basis of Hydraulic jump theory and Khosla's theory. A safe exit gradient of $1/6$ may be assumed. 0.5 metres retrogression and 20% discharge concentration may be assumed where non-uniform flow is likely to occur. Assume any other data if not given.

Fig. 11.19

Solution. Fixing the Crest Levels and Waterway

Crest Levels. The average bed level of the river is given to be 257.0 m, which may be taken as the crest level of the undersluices. The upstream floor of the undersluices may be kept the same, and thus there will be no raised crest in the undersluices. The crest level of other barrage bays may be kept 1.0 to 1.5 m higher than the crest level of undersluices. Let us keep it 1.3 m higher, i.e. say $257.0 + 1.3 = 258.3$ m.

Waterway : The waterway, as per Lacey's wetted perimeter equation, is given by

$$\begin{aligned}
 P &= 4.75 \sqrt{Q} \\
 &= 4.75 \sqrt{8100} = 4.75 \times 90 = 427.5 \text{ m.}
 \end{aligned}$$

Now let us provide a waterway approximately equal to $1.2 P$ by trial, in such a way that approximately 15 to 20% of the discharge is passed through the undersluices and the total provided waterway should be able to pass the entire discharge.
