IEEE Digital Signal Processing Workshop ,1994 Statistical Digital Signal Processing and Modeling Monson H. Hayes,1996-04-19 This new text responds to the dramatic growth in digital signal processing DSP over the past decade and is the product of many years of teaching an advanced DSP course at Georgia Tech While the focal point of the text is signal modeling it integrates and explores the relationships of signal modeling to the important problems of optimal filtering spectrum estimation and adaptive filtering Coverage is equally divided between the theory and philosophy of statistical signal processing and the algorithms that are used to solve related problems The text reflects the author s philosophy that a deep understanding of signal processing is accomplished best through working problems For this reason the book is loaded with worked examples homework problems and MATLAB computer exercises While the examples serve to illustrate the ideas developed in the book the problems seek to motivate and challenge the student and the computer exercises allow the student to experiment with signal processing algorithms on complex signals Professor Hayes is recognized as a leader in the signal processing community particularly for his work in signal reconstruction and image processing This text is suitable for senior graduate level courses in advanced DSP or digital filtering found in Electrical Engineering Departments Prerequisites include basic courses in DSP and probability theory Mathematical Aspects of Signal Processing Pradip Sircar,2016-10-13

describes how a key signal image processing algorithm that of the fast Hartley transform FHT or via a simple conversion routine between their outputs of the real data version of the ubiquitous fast Fourier transform FFT might best be formulated to facilitate computationally efficient solutions The author discusses this for both 1 D such as required for example for the spectrum analysis of audio signals and m D such as required for example for the compression of noisy 2 D images or the watermarking of 3 D video signals cases but requiring few computing resources i e low arithmetic memory power requirements etc This is particularly relevant for those application areas such as mobile communications where the available silicon resources as well as the battery life are expected to be limited The aim of this monograph where silicon based computing technology and a resource constrained environment is assumed and the data is real valued in nature has thus been to seek solutions that best match the actual problem needing to be solved
